

# 2019 Monitoring Summary

## Chipco Creek at Coosa County Rd. 34 (32.96090/-86.25259)

### BACKGROUND

Chipco Creek is among the least-disturbed watersheds within the Southern Inner Piedmont ecoregion, based on landuse, road density, and population density. Since 2010, it has been monitored by the Alabama Department of Environmental Management (ADEM) as a “high quality” reference watershed for comparison with other streams within the ecoregion. Habitat and macroinvertebrate community surveys were conducted to assess the health of the biological communities. Data from reference watersheds are used to characterize natural or background conditions expected in different ecoregions throughout the state. Chipco Creek was sampled in 2019 to provide high-quality reference reach data for Southern Inner Piedmont streams.

**Figure 1.** Chipco Creek at CHPC-1, April 30, 2019.

### WATERSHED CHARACTERISTICS

Watershed characteristics are summarized in Table 1. Chipco Creek is a *Fish & Wildlife (F&W)* stream located near Rockford, AL in the Coosa River basin. According to the 2011 National Land Cover Dataset, the watershed is mostly forested, with approximately 79% forest. There are no permitted outfalls. This watershed is of exceptional quality and is very sparsely populated, and has undergone very little development. The watershed has a very low road density.

### REACH CHARACTERISTICS

General observations (Figure 1, Table 2) and a habitat survey (Table 3) were completed during the macroinvertebrate assessment. In comparison with reference reaches in the same ecoregion, they give an indication of the physical condition of the site and the quality and availability of habitat. Like other streams in ecoregion 45a, Chipco Creek at CHPC-1 is a high gradient stream characterized predominantly by a cobble and gravel substrate. Overall habitat quality and availability has been rated as *Optimal* for supporting the macroinvertebrate communities due to a large riparian buffer, low sediment deposition, and stable banks.

**Table 1.** Summary of general watershed characteristics: CHPC-1

| Watershed Characteristics                             |                     |
|-------------------------------------------------------|---------------------|
| Basin                                                 | Coosa               |

BIOASSESSMENT RESULTS

The benthic macroinvertebrate community was sampled using ADEM’s Intensive Multi-habitat Bioassessment methodology (WMB-I). Measures of taxonomic richness, community composition and pollution tolerance were used to assess the overall health of the macroinvertebrate community in comparison to conditions expected in central Alabama streams and rivers. Each site is placed in one of six levels ranging from 1, or *natural*, to 6, or *highly altered*.

The macroinvertebrate community on Chipco Creek at CHPC-1 was rated as *excellent*, with 78 total taxa, 13 rare, highly sensitive taxa (Attribute 2), 38 ubiquitous, sensitive taxa (Attribute 3), and 23 Attribute 2 and 3 EPT. The community was comprised of 49% attribute 2 and 3 taxa (Table 4).

**Table 4.** Results of the macroinvertebrate survey conducted on Chipco Creek at CHPC-1, April 30, 2019.

| Macroinvertebrate Assessment                    | Results                    | Scores |

WATER CHEMISTRY

Results of water chemistry analyses are summarized in Table 5. In situ measurements and water samples were collected during March through October 2019 to help characterize the reach. Specific conductance and hardness values were higher than the median concentration of all verified ecoregional reference data collected in the ecoregion 45a. E.coli was documented as exceeding the *F&W* single sample criterion during the October sampling.

SUMMARY

The ADEM monitors Chipco Creek as a “high-quality” reference reach for comparison with other streams in the Southern Inner Piedmont ecoregion. Chipco Creek at CHPC-1 is typical of streams in the region, characterized by high gradient streams with a cobble and gravel substrate.

Water quality conditions are very high. E.coli was documented as exceeding the *F&W* single sample criterion during the October sampling. The overall habitat quality and availability has been rated as *Optimal* for supporting the macroinvertebrate communities, which is rated as *Excellent* due to high diversity and taxa richness within the reach.

**Table 5.** Summary of water quality data collected during March through October, 2019. Minimum (Min) and maximum (Max) values calculated using minimum detection limits (MDL) when results were less than this value. Median, average (Avg), and standard deviations (SD) values were calculated by multiplying the MDL by 0.5 when results were less than this value.
