Cavenham Forest Industries LLC
Mobile, Alabama
EPA I.D. Number ALD 057 226 904

FACT SHEET

A draft renewal of the Alabama Hazardous Waste Management and Minimization Act (AHWMMA) permit has been prepared for the Cavenham Forest Industries LLC facility. This hazardous waste facility is located in Mobile, Alabama. This fact sheet has been prepared to briefly advise the public of the principal permitting, legal and policy issues of the draft permit.

I. PERMIT PROCESS

The purpose of the permitting process is to allow the State and the public to evaluate Cavenham Forest Industries LLC's ability to comply with the hazardous waste management requirements of the AHWMMA, as amended. Cavenham Forest Industries LLC must comply with hazardous waste management conditions set forth in the permit during the effective period of the permit, which is ten (10) years from the effective date of this permit.

II. PROCEDURES FOR REACHING A FINAL DECISION

The Alabama Department of Environmental Management (ADEM or Department) is proposing to issue Cavenham Forest Industries LLC a permit renewal for post-closure care for the Vacuum Ponds (SWMU 12), Sand Filtration Beds (SWMU 14), Aeration Pond (SWMU 16) and Container Storage Area (SWMU 21) which were closed as one closed landfill unit (SWMU 1) with wastes and/or contaminated soils remaining in-place.

ADEM Admin. Code r. 335-14-8-.08(6)(b)1. requires that the public be given at least a 45-day comment period for each draft permit. The comment period will begin on September 10, 2025, which is the date of publication of the public notice in major local newspaper(s) of general circulation, and will end on October 27, 2025. The public notice will also be broadcast over local radio station(s).

Any person interested in commenting on the application or draft permit must do so within the 45-day comment period discussed above.

All persons wishing to comment on any of the permit conditions or the permit application should submit their comments in writing to the Alabama Department of Environmental Management, Permits and Services Division, 1400 Coliseum Blvd. (zip 36110-2059), P.O. Box 301463 (zip 36130-1463) Montgomery, Alabama, ATTENTION: Mr. Russell A. Kelly.

ADEM will consider all written comments received during the comment period while making a permit decision for this facility. When the Department makes its final permit decision, notice will be given to the applicant and each person who has submitted written comments or requested notice of the final permit decision.

III. FACILITY DESCRIPTION

Cavenham Forest Industries LLC has applied for permit renewal under the requirements of AHWMMA for post-closure care including corrective action for groundwater contamination. Cavenham Forest Industries LLC is the owner of the closed facility in Mobile, Alabama that used to manufacture treated wood products. Creosote and pentachlorophenol were used in the manufacturing process to preservative treat poles and piles at elevated temperature and pressure. Four RCRA hazardous management waste units were utilized in the treatment process during the operating history. RCRA's hazardous waste management units included an Aeration Pond, two (2) vacuum ponds, Sand filtration Beds, and a Container Storage area. The proposed permit contains provisions for post-closure care for the Vacuum Ponds (SWMU 12), Sand Filtration Beds (SWMU 14), Aeration Pond (SWMU 16) and Container Storage Area (SWMU 21) which were closed as one capped landfill unit (SWMU 1) with wastes and/or contaminated soils remaining in-place. The proposed permit also contains provisions for corrective action for groundwater contamination, which includes upper and lower aquifer recovery and injection wells, and recovered groundwater treatment system.

Additional provisions have been included in the permit as a result of the changes made to AHWMMA to incorporate the requirements of the 1984 Hazardous and Solid Waste Amendments (HSWA) to RCRA. These requirements are included in accordance with ADEM Admin. Code r. 335-14-5-.06(12), which addresses corrective action for Solid Waste Management Units (SWMUs). This rule requires a RCRA Facility Assessment (RFA) of all SWMUs to be conducted at the facility. The RFA for Cavenham Forest Industries LLC has been Completed and SWMUs have been identified. All SWMUs are recommended for further sampling and corrective action if necessary.

Alabama Department of Environmental Management

HAZARDOUS WASTE FACILITY PERMIT

PERMITTEE:	**Cavenham Forest Industries LLC**
ADDRESS:	**South End of Herbert Street Mobile, Alabama 36601**
PERMIT NUMBER:	**ALD 057 226 904**
UNITS PERMITTED:	**Post-Closure Care of: Vacuum Ponds* Aeration Ponds* Sand Filtration Beds (2) * Container Storage Area* *Closed as a single landfill unit (SWMU 1)**
ISSUANCE DATE:	**XX XX, 2025**
EFFECTIVE DATE:	**XX XX, 2025**
EXPIRATION DATE:	**XX XX 2035**

This Permit is issued pursuant with the Code of Alabama 1975, §§ 22-30-1-et. seq., as amended, and regulations adopted thereunder and the Hazardous Wastes Management and Minimization Act and in accordance with the plans and specifications and applications filed with the Department subject to the conditions appended hereto, all of which are considered a part of this Permit. This Permit shall be subject to all applicable laws of the State of Alabama, rules and regulations and orders of the Department of Environmental Management and shall be effective from the date of issuance.

DRAFT

ALABAMA DEPARTMENT OF ENVIRONMENTAL MANAGEMENT
HAZARDOUS WASTE PERMIT

Permittee:

OWNER:
Cavenham Forest Industries LLC
600 River Avenue, Suite 200
Pittsburgh, Pennsylvania 15212

OPERATOR:
Cavenham Forest Industries LLC
South End of Herbert Street
Mobile, Alabama 36652
Mobile County

Permit Number: ALD 057 226 904
Identification Number: ALD 057 226 904

DRAFT

Pursuant to the Alabama Hazardous Wastes Management and Minimization Act (AHWMMA), Code of Ala. 1975, Section 22-30-1, et. seq., as amended, and attendant regulations promulgated thereunder by the Alabama Department of Environmental Management (ADEM or the Department), a permit is issued to Cavenham Forest Industries LLC for the facility located in Mobile Alabama, at latitude N 30° 43' 46" and longitude W 88° 03' 01".

The Permittee must comply with all terms and conditions of this permit, which consists of the conditions set forth herein (including those in any attachments), and the regulations applicable to the Permittee's facility contained in Chapters 335-14-1, 335-14-2, 335-14-5, 335-14-8, and 335-14-9 of the ADEM Administrative Code of Regulations (hereinafter referred to as the "ADEM Admin. Code r."). Applicable regulations are those which are in effect on the date of issuance of this permit.

This permit is based on the assumption that the information submitted in the permit application attached to the Permittee's letter dated April 6, 2023, as modified by subsequent amendments dated June 18, 2024, September 27, 2024, January 14, 2025, and August 22, 2025 (hereby incorporated by reference and hereafter referred to as the Application) is accurate and that the facility will be constructed and operated as specified in the Application. Any inaccuracies found in this information could lead to the termination or modification of this permit in accordance with ADEM Admin. Code r. 335-14-8-.04(2), 335-14-8-.04(3), and 335-14-8-.04(4) and could lead to potential enforcement action. The Permittee must inform ADEM of any deviation from or changes in the information provided in the Application that would affect the Permittee's ability to comply with the applicable regulations or permit conditions.

This permit is effective as of xx xx, 2025 and shall remain in effect until xx xx, 2035 unless revoked and reissued, or terminated under ADEM Admin. Code r. 335-14-8-.04(2) and 335-14-8-.04(4) or continued in accordance with ADEM Admin. Code r. 335-14-8-.05(2).

Part A and Part B Permit Application submitted on April 6, 2023, as modified by subsequent amendments dated June 18, 2024, September 27, 2024, January 14, 2025, and August 22, 2025.

DRAFT

PART I

STANDARD FACILITY CONDITIONS

I.A. EFFECT OF PERMIT

Issuance of this permit does not authorize any injury to persons or property, any invasion of other private rights, or any infringement of state or local law or regulations. Compliance with the terms of this permit does not constitute a defense to any action brought under the AHWMMA, or any other law governing the protection of public health or the environment, for any imminent and substantial endangerment to human health, welfare, or the environment. (ADEM Admin. Code Rule 335-14-8-.01(4)).

I.B. SEVERABILITY

The provisions of this permit are severable and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected thereby.

I.C. DUTIES AND REQUIREMENTS

1. Duty to Comply

   The Permittee shall comply with all conditions of this permit, except to the extent and for the duration such noncompliance is authorized by an emergency permit. Any permit noncompliance, other than noncompliance authorized by an emergency permit, constitutes a violation of the AHWMMA, and is grounds for enforcement action, permit termination, revocation and reissuance, modification, or denial of a permit renewal application.

2. Duty to Reapply

   a. If the Permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the Permittee must apply for and obtain a new permit. The application for a new permit must be submitted at least 180 calendar days before the expiration of this permit, as required by ADEM Admin. Code Rule 335-14-8-.03(1)(b)2.

   b. SWMU Corrective Action Requirements

      The Permittee must submit an application for a new permit for both post-closure and Solid Waste Management Unit (SWMU) corrective measures at least 180 calendar days before the expiration of this permit. The Permittee must reapply in order to fulfill the 30-year post-closure care period required by ADEM Admin. Code Rule 335-14-5-.07(8)(a)1. The Department may shorten or extend the post-closure care period applicable to the hazardous waste facility in accordance with ADEM Admin. Code Rules 335-14-5-.07(8)(a)2. and 335-14-8-.03(1)(b).

DRAFT

3. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for the Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

4. Duty to Mitigate

In the event of noncompliance with this permit, the Permittee shall take all reasonable steps to minimize releases to the environment, and shall carry out such measures as are reasonable to prevent significant adverse impacts on human health or the environment.

5. Proper Operation and Maintenance

The Permittee shall, at all times, properly operate and maintain all facilities and systems of treatment, monitoring, and control (and related appurtenances) which are installed or used by the Permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance (O&M) includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of this permit.

6. Permit Actions

This permit may be modified, revoked and reissued, or terminated for cause as specified in ADEM Admin. Code Rules 335-14-8-.04(2), 335-14-8-.04(3), and 335-14-8-.04(4). The filing of a request for a permit modification, revocation and reissuance, or termination, or the notification of planned changes or anticipated noncompliance on the part of the Permittee does not stay the applicability or enforceability of any permit condition.

7. Property Rights

Issuance of this permit does not convey any property rights of any sort, nor any exclusive privilege.

8. Duty to Provide Information

The Permittee shall furnish to the Department, within a reasonable time as determined by the Department, any relevant information which the Department may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with this permit. The Permittee shall also furnish to the Department, upon request, copies of records required to be kept by this permit.

9. Inspection and Entry

The Permittee shall allow duly designated officers and employees of the Department, or an authorized representative, upon the presentation of credentials and other documents as may be required by law, to:

DRAFT

a. Enter at reasonable times upon the Permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit;

b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;

c. Inspect, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and,

d. Sample or monitor, at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the AHWMMA, any substances or parameters at any location. The Permittee shall have the opportunity to split samples during sampling.

10. Monitoring and Records

a. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. The method used to obtain a representative sample of the waste to be analyzed must be the appropriate method from ADEM Admin. Code Rule 335-14-2-Appendix I, or the methods specified in Attachment P of the permit application. Laboratory methods must be those specified in Test Methods for Evaluating Solid Waste: Physical/Chemical Methods SW-846 (latest edition), Methods for Chemical Analysis of Water and Wastes (EPA-600/4-79-020), Standard Methods for the Examination of Water and Wastewater (latest edition), the methods specified in Attachment P of the permit application, or an alternative method approved by ADEM. [ADEM Admin. Code Rule 335-14-8-.03(1)(j)1.]

b. The Permittee shall maintain, at the facility, records of all monitoring information including all calibration and maintenance records, all original strip chart recordings for continuous monitoring instrumentation, the certification required by ADEM Admin. Code Rule 335-14-5-.05(4)(b)9, records of all data used to prepare documents required by this permit, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three (3) years from the date of the certification, application, sample, measurement, report or record, or until corrective action is completed, whichever date is later. This period may be extended by the Department at any time and is automatically extended during the course of any unresolved enforcement action regarding this facility. [ADEM Admin. Code Rules 335-14-5-.05(5)(b) and 335-14-8-.03(1)(j)2.]

c. The Permittee shall maintain, at the facility, records of all groundwater monitoring wells, piezometers, and associated groundwater surface elevations throughout the term of this permit. These records shall include the surveyed location, surveyed elevation, surveyed elevation reference point, total depth, screened interval, construction details, well log, and all other pertinent information for each well and piezometer.

d. Records for monitoring information shall include:

DRAFT

i. The date(s), exact place, and times of sampling or measurements;

ii. The names of individual(s) who performed the sampling or measurements;

iii. The date(s) analyses were performed;

iv. The names of individual(s) who performed the analyses;

v. The analytical techniques or methods used; and,

vi. The results of such analyses.

e. The following documents and information shall be maintained throughout the term of this permit at the Facility:

i. Complete copy of this permit and the permit application.

ii. Operating record as required by ADEM Admin. Code Rule 335-14-5-.05(4) and this permit.

iii. Copies of all plans, reports, inspection schedules, and inspection logs as required by ADEM Admin. Code Chapter 335-14-5 and this permit.

11. Signatory Requirements

All applications, reports or information required by this permit and submitted to the Department shall be signed and certified in accordance with ADEM Admin. Code Rules 335-14-8-.02(2) and 335-14-8-.03(1)(k).

12. Reporting Requirements

a. Planned Changes

The Permittee shall give notice to the Department as soon as possible of any planned physical alterations or additions to the permitted facility and any solid waste management units identified under Part IV of this permit.

b. Anticipated Noncompliance

The Permittee shall give advance notice to the Department of any planned changes in the permitted facility or activity that may result in noncompliance with permit requirements.

c. Transfer of Permits

This permit may be transferred to a new owner or operator only if it is modified or revoked and reissued pursuant to ADEM Admin. Code Rules 335-14-8-.04(1) or 335-14-8-.04(3)(a)1.(vii). Before transferring ownership or operation of the facility during the term of this permit, the Permittee shall notify the new owner or

DRAFT

operator, in writing, of the requirements of ADEM Admin. Code Chapters 335-14-5 and 335-14-8 and this permit.

d. Monitoring Reports

Monitoring results shall be reported at the intervals specified elsewhere in this permit.

e. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted to the Department no later than 14 calendar days following each schedule date.

f. Twenty-Four Hour Reporting

i. The Permittee shall report to the Department any noncompliance with this permit that may endanger human health or the environment. Any such information shall be reported orally within 24 hours from the time the Permittee becomes aware of the circumstances. This report shall include, but is not limited to, the following:

(I) Information concerning the release of any hazardous waste which may endanger public drinking water supplies; and,

(II) Information concerning the release or discharge of any hazardous waste, or hazardous waste constituents, or of a fire or explosion at the facility, which could threaten the environment or human health outside the facility.

ii. The description of the occurrence and its cause shall include:

(I) Name, address, and telephone number of the owner or operator;

(II) Name, address, telephone number, and EPA Identification Number of the facility;

(III) Date, time, and type of incident;

(IV) Name and quantity of material(s) involved;

(V) The extent of injuries, if any;

(VI) An assessment of actual or potential hazards to the environment and human health outside the facility, where this is applicable; and,

(VII) Estimated quantity and disposition of recovered material that resulted from the accident.

DRAFT

iii. A written submission shall also be provided within 5 calendar days of the time that the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the periods of noncompliance (including exact dates and times); whether the noncompliance has been corrected, and if not, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

g. Other Noncompliance

The Permittee shall report to the Department all instances of noncompliance not otherwise required by Permit Conditions I.C.12.d., I.C.12.e., or I.C.12.f. at the time any other reports required by this permit are submitted. The reports shall contain the information required by Permit Condition I.C.12.f.

h. Other Information

Where the Permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Department, it shall promptly submit such facts or information. In addition, upon request, the Permittee shall furnish to the Department any information related to compliance with this permit.

13. Certification of Construction

The Permittee may not commence treatment, storage or disposal of hazardous waste or contaminated media at any new or modified portion of the facility until the Permittee has submitted to the Department, by certified mail or hand-delivery, a letter (together with the certification by the Construction Quality Assurance (CQA) officer required by ADEM Admin. Code Rule 335-14-5-.02(10)(d) and any other certifications required by this permit or ADEM Admin. Code Division 335-14 signed by the Permittee and an Alabama-registered Professional Engineer stating that the facility has been constructed or modified in compliance with this permit where appropriate; and,

a. The Department has inspected the modified or newly constructed facility and finds it is in compliance with the conditions of this permit; [ADEM Admin. Code Rule 335-14-8-.03(1)(1)2(ii)(I).] or

b. The Department has either waived the inspection or has not notified the Permittee, within 15 calendar days of the notification from the Permittee, of its intent to inspect. [ADEM Admin. Code Rule 335-14-8-.03(1)(1)2(ii)(II)]

14. The Permittee shall assure that all measures necessary to maintain and/or achieve compliance with all applicable requirements of ADEM Admin. Code Division 335-14 are taken during the active life of the facility, post-closure care period, corrective action period, and throughout the term of this permit.

15. In the event that circumstances beyond the Permittee's control arise to prevent achievement of any deadline set forth by this permit, the Permittee may immediately, upon the occurrence thereof, request an extension by sending a written request to the Department explaining the need for the extension. The Department may, after

DRAFT

consideration of the circumstances, grant the extension. Requests for extensions may require a permit modification pursuant to ADEM Admin. Code Rules 335-14-8-.04(2) or 335-14-8-.04(3).

I.D. CONFIDENTIAL INFORMATION

The Permittee may claim confidential any information required to be submitted by this permit if the information is protected under the Code of Alabama 1975, §22-30-18, as amended. The term "trade secret" as used in §22-30-18 is defined in the Code of Alabama 1975, §22-30-2(12).

I.E. DEFINITIONS

For the purposes of this permit, terms used herein shall have the same meaning as those in ADEM Admin. Code Chapters 335-14-1, 335-14-2, 335-14-5, and 335-14-8, unless this permit specifically provides otherwise. Where terms are not defined in the regulations or this permit, a standard dictionary reference or the generally accepted scientific or industrial meaning of the term shall define the meaning associated with such terms.

"Area of concern" (AOC), for the purposes of this permit, includes any area having a probable release of a hazardous waste or hazardous constituent which is not from a solid waste management unit and is determined by the Department to pose a current or potential threat to human health or the environment. Such areas of concern may require investigations and remedial action as required under Section 3005(c)(3) of the Resource Conservation and Recovery Act and ADEM Admin. Code Rule 335-14-8-.03(3)(b)2. to ensure adequate protection of human health and the environment.

"Contamination", for the purposes of this permit, refers to the presence of any hazardous constituent in a concentration that exceeds the naturally occurring concentration of that constituent in the immediate vicinity of the facility (i.e., areas not affected by the facility).

"Corrective action", for the purposes of this permit, is the sum of all corrective measures necessary to protect human health and the environment for all releases of hazardous constituents from any SWMU at the facility, regardless of the time at which waste was placed in the unit, as required by ADEM Admin. Code Rules 335-14-5-.06(11) and/or 335-14-5-.06(12). Corrective measures may address releases to air, soils, surface water, or groundwater.

"Corrective Action Management Unit" (CAMU), for the purposes of this permit, includes any area within a facility that is designated by the Department under ADEM Admin. Code Rule 335-14-5-.19 for the purpose of implementing corrective action requirements under ADEM Admin. Code Rule 335-14-5-.06(12), §22-30-19 et seq., Code of Alabama 1975, and/or RCRA section 3008(h). A CAMU shall only be used for the management of remediation waste pursuant to implementing such corrective actions requirements at the facility.

"Corrective measures", for the purposes of this permit, include all individual measures taken and/or necessary to remedy releases and to protect human health and the environment for all releases of hazardous waste or hazardous constituents from any SWMU at the facility, regardless of the time at which waste was placed in the unit, as required under ADEM Admin. Code Rule 335-14-5-.06(12). Corrective measures may address releases to air, soils, surface water, or groundwater. The sum of all individual corrective measures is known as corrective action.

DRAFT

"Extent of contamination", for the purposes of this permit, is defined as the horizontal and vertical areas in which the concentrations of hazardous constituents in the environmental media being investigated are above detection limits or background concentrations indicative of the region, whichever is appropriate as determined by the Department.

"Groundwater Protection Standard", for the purposes of this permit, refers to a groundwater concentration limit which is established pursuant to ADEM Admin. Code Rule 335-14-5-.06(3).

"Hazardous constituents", for the purposes of this permit, are those substances listed in ADEM Admin. Code Rule 335-14-2-Appendix VIII and/or ADEM Admin. Code Rule 335-14-5-Appendix IX and include hazardous constituents released from solid waste, hazardous waste, and hazardous waste constituents that are reaction by-products.

"Interim measures", for the purposes of this permit, are actions necessary to minimize or prevent the further migration of contaminants and limit actual or potential human and environmental exposure to contaminants while long term corrective action remedies are evaluated and, if necessary, implemented.

"Land Disposal", for the purposes of this permit, and ADEM Admin. Code Chapter 335-14-9 means placement in or on the land and includes, but is not limited to, placement in a landfill, surface impoundment, waste pile, injection well, land treatment facility, salt dome formation, underground mine or cave, or concrete vault or bunker intended for disposal purposes.

"Landfill", for the purposes of this permit, includes any disposal facility or part of a facility where hazardous waste is placed in or on the land and which is not a pile, a land treatment facility, a surface impoundment, an underground injection well, a salt dome formation, a salt bed formation, an underground mine, a cave, or a corrective action management unit.

"Land Use Controls", for the purposes of this permit, is as defined by ADEM Admin. Code Rule 335-15-1-.02.

"Method detection limit" (MDL), for the purposes of this permit, means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

"Non-regulated waste", for the purposes of this permit, means waste that is not otherwise regulated as RCRA listed and/or characteristic hazardous waste. In this case, non-regulated includes, but it not limited to, solid and universal waste, used oil, PCB, etc. Universal waste and used oil are subject to ADEM Admin. Code Chapter 335-14-11, Standards for Universal Waste Management and ADEM Admin. Code Chapter 335-14-17, Standards for the Management of Used Oil, respectively.

"Operating day", for the purposes of this permit, means any day on which hazardous waste is treated, stored, or disposed of in a unit. For example, each day that a hazardous waste storage unit contains hazardous waste is an operating day, as is each day that a disposal unit contains or receives hazardous waste, or each day that hazardous waste is treated in a treatment unit.

"Release", for the purposes of this permit, includes any spilling, leaking, pouring, emitting, emptying, discharging, injecting, escaping, leaching, pumping, or disposing into the environment of any hazardous waste or hazardous constituent.

DRAFT

"Remediation waste" for the purpose of this permit includes all SWMUs and all media (including groundwater, surface water, soils, and sediments) and debris, which contain listed hazardous wastes or which themselves exhibit a hazardous waste characteristic, that are managed for the purpose of implementing corrective action requirements under ADEM Admin. Code Rule 335-14-5-.06(12) and RCRA Section 3008(h). For a given facility, remediation wastes may originate only from within the facility boundary, but may include waste managed in implementing RCRA Sections 3004(v) or 3008(h) for releases beyond the facility boundary.

"Solid waste", for the purposes of this permit, means any garbage, refuse, sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility and other discarded materials, including solid, liquid, semisolid, or contained gaseous materials resulting from industrial, commercial, mining, and agricultural operations, and from community activities. It does not include solid or dissolved material in domestic sewage, or solid or dissolved materials in irrigation return flows or industrial discharges which are point sources subject to permits under Section 402 of the Federal Water Pollution Control Act, as amended (86 Stat. 880), or source, special nuclear, or by-product material as defined by the Atomic Energy Act of 1954, as amended (68 Stat. 923).

"Solid waste management unit" (SWMU), for the purposes of this permit, includes any unit that has been used for the treatment, storage or disposal of solid waste at any time, irrespective of whether the unit is or ever was intended for the management of solid waste. RCRA-regulated hazardous waste management units are also solid waste management units. SWMUs include areas that have been contaminated by routine and systematic releases of hazardous waste or hazardous constituents, excluding one-time accidental spills that are immediately remediated and cannot be linked to solid waste management activities (*e.g.*, product or process spills).

"Storm event", for the purposes of this permit, is defined as a 1-year, 24-hour storm event or rainfall that measures 1 inch or greater in 1 hour or less. Rainfall measurements may be taken at the site, or the closest official weather monitoring station may be used.

"Unit", for the purposes of this permit, includes any contiguous discernable area used for the management of hazardous waste (or non-hazardous waste in the case of a SWMU) and may include, but is not limited to, any landfill, surface impoundment, waste pile, land treatment unit, incinerator, injection well, tank, container storage area, septic tank, drain field, wastewater treatment unit, elementary neutralization unit, transfer station, recycling unit or the OB and OD units.

DRAFT

I.F. EXPIRATION AND CONTINUATION OF PERMIT

This permit and all conditions herein will remain in effect beyond this permit's expiration date if the Permittee has submitted a new application as required by Permit Condition I.C.2. and, through no fault of the Permittee, the Department has not issued a new permit (ADEM Admin. Code Rules 335-14-8-.05(1) and 335-14-8-.05(2)).

I.G. WASTE MINIMIZATION

1. Certification Requirements

Pursuant to ADEM Admin. Code Rule 335-14-5-.05(4)(b)9, the Permittee must certify, no less often than annually, that:

a. The Permittee has a program in place to reduce the volume and toxicity of hazardous waste to the degree determined by the Permittee to be economically practicable; and,

b. The proposed method of treatment, storage, or disposal is the most practicable method available to the Permittee and that it minimizes the present and future threat to human health and the environment.

2. Recording Requirements

a. The Permittee shall maintain copies of this certification in the facility operating record as required by ADEM Admin. Code Rule 335-14-5-.05(4)(b)9.

b. The Waste minimization Program required under I.G.1. should at a minimum address the following topics:

i. Identity of each hazardous waste stream and the source of generation.

ii. Types and amount of hazardous waste that is generated at the facility.

iii. Present and proposed method of treatment, storage, or disposal that is available to the Permittee.

iv. Description of techniques implemented in the past for hazardous waste reduction and their effectiveness.

v. An evaluation of technically and economically feasible hazardous waste reduction techniques.

vi. A program and schedule for implementing the selected hazardous waste reduction technique.

DRAFT

I.H. COST ESTIMATES

1. The Permittee shall maintain detailed written cost estimates, in current dollars, at the location specified in Permit Condition I.C.10.e. and on file with ADEM in accordance with ADEM Admin. Code Rules 335-14-5-.08(3), 335-14-5-.08(5), and 335-14-5-.08(10).

2. All cost estimates must be updated annually as required by ADEM Admin. Code Rules 335-14-5-.08(3)(b), 335-14-5-.08(5)(b), and 335-14-5-.08(10)(b).

3. The cost estimate shall be maintained and submitted in the form designated by the Department.

4. The Permittee must update the cost estimate no later than 30 calendar days after the Department has approved a modification to the Closure Plan, Post-Closure Plan, or

Corrective Action Plan, or any other plan required or referenced by this permit, if the change in the plan results in an increase in the amount of the cost estimate.

I.I. FINANCIAL ASSURANCE

1. The Permittee shall demonstrate continuous compliance with ADEM Admin. Code Rule 335-14-5-.08 by providing documentation of financial assurance in at least the amount that equals or exceeds the cost estimate. Changes in financial assurance mechanisms must be approved by the Department.

2. The Permittee shall submit itemized statements for all capital expenditures and a complete, revised cost estimate to the Department when requesting approval for a reduction in the financial assurance mechanism.

I.J. PERMIT MODIFICATIONS

The Permittee shall request a permit modification whenever changes in operating plans or facility design affect any plan (*e.g.* groundwater monitoring, closure, post-closure, or corrective action) required or referenced by this permit. The Permittee must submit a written request for a permit modification, pursuant to the requirements of ADEM Admin. Code Rule 335-14-8-.04(2), at least 60 calendar days prior to the proposed change in facility design or operation.

I.K. REPORTS, NOTIFICATIONS, AND SUBMISSIONS TO THE DEPARTMENT

One hard copy and one electronic (an optical character recognition or text-searchable) copy of all reports, notifications, or other submissions that are required by this permit should be sent via certified mail or given to:

Chief, Land Division
Alabama Department of Environmental Management
P.O. Box 301463 (Zip 36130-1463)
1400 Coliseum Boulevard (Zip 36110-2059)
Montgomery, Alabama

and

Director, RCRA Division
USEPA Region 4
Atlanta Federal Center
61 Forsyth Street SW
Atlanta, Georgia 30303-3104

DRAFT

PART II

POST-CLOSURE CARE

II.A. POST-CLOSURE CARE PERIOD

The post-closure care period shall extend for a period of thirty (30) years after the date of issuance of a post-closure permit unless shortened or extended pursuant to ADEM Admin. Code r. 335-14-5-.07(8). The post-closure care period shall automatically extend through the end of the compliance period specified in Part III of this permit.

II.B. POST-CLOSURE PROCEDURES AND USE OF PROPERTY

1. Post-Closure Activities

   The Permittee shall conduct post-closure care activities, in accordance with Section 8 of the permit application and as required by ADEM Admin. Code r. 335-14-5-.07 and 335-14-5-.14(11)(d), for each hazardous waste management unit listed in Table II.1. Post-closure care shall commence upon the effective date of this permit and shall continue throughout the post-closure care period.

2. Security

   The Permittee shall comply with the security provisions of ADEM Admin. Code r. 335-14-5-.02(5) and as described in Section 3 of the permit application.

3. Disturbance of Closed Unit(s)

   The Permittee shall not allow the disturbance of the integrity of the final cover, liners, any components of the containment system, or the function of the facility's monitoring systems during the post-closure care period for any unit identified in Table II.1.

4. The Permittee shall:

   a. Maintain the integrity and effectiveness of the landfills' final cover, including making repairs to the cap, as necessary, to correct the effects of settling, subsidence, erosion, or other events;

   b. Maintain and monitor the groundwater monitoring system and comply with all other applicable requirements of ADEM Admin. Code r. 335-14-5-.06 and Part III of this permit;

   c. Prevent run-on and run-off from eroding or otherwise damaging the final cover; and,

   d. Protect and maintain surveyed benchmarks used in complying with the surveying and recordkeeping requirements of ADEM Admin. Code r. 335-14-5-.14(10).

DRAFT

e. Maintain the integrity and effectiveness of the gradient control system, synthetic lined cutoff wall in accordance with attachment R of the permit application.

II.C. INSPECTIONS

1. The Permittee shall inspect the components, structures, and equipment at the site in accordance with the inspection schedule as described in Section 4 of the permit application, the post-closure care plan as described in Section 8 of the permit application, and as required by ADEM Admin. Code Rules 335-14-5-.02(6) and 335-14-5-.07.

2. Monitoring and Inspection

The Permittee shall inspect the closed hazardous waste management unit(s) listed in Table II.1 at least monthly and after storms to detect any evidence of deterioration or improper operation as described in Section 4 of the permit application and as required under ADEM Admin. Code Rules 335-14-5-.02(6), 335-14-5-.07 and 335-14-5-.14. The inspections shall specifically include evaluation of the following items:

a. Integrity of the final cover (erosion, ponding, subsidence, cracking, *etc.*);

b. Growth and stabilization of vegetative cover;

c. Run-on and run-off control system;

d. Groundwater monitoring wells;

e. Survey benchmarks; and,

f. Facility fences, gates, survey marks, drainage ditches, activated Carbon, effluent system piping and pumps.

** These individual units were closed as a single landfill in accordance with Rules 335-14-6-.11(9) and 335-14-6-.14(11).

DRAFT

PART III

GROUNDWATER MONITORING AND CORRECTIVE ACTION

III.A. REQUIRED PROGRAM(S)

1. Groundwater monitoring shall consist of the General Groundwater Monitoring Program of Permit Condition III.B., and the Corrective Action Monitoring Program contained in Permit Condition III.E as applicable.

2. The Permittee shall continue groundwater monitoring as required by this permit not later than 120 calendar days after the effective date of this permit.

III.B. GENERAL GROUNDWATER MONITORING PROGRAM

1. Well Location, Installation and Construction

The Permittee shall install and/or maintain a groundwater monitoring system to comply with the requirements of ADEM Admin. Code Rules 335-14-5-.06(8), 335-14-5-.06(9), 335-14-5-.06(10), and 335-14-5-.06(11) as applicable and as specified below:

a. The Permittee shall maintain all groundwater monitoring wells at the facility as identified in Table III.1. of this permit, at the locations specified on Figures P-1 of the permit application, and any other groundwater monitoring wells specified by Permit Condition III.B.1.d.

i. All groundwater monitoring wells shall be maintained and inspected in accordance with the plans and specifications presented in Section 8 of the permit application and in accordance with ADEM Admin. Code Rule 335-14-5-.06.

ii. A groundwater monitoring well shall not be removed from any monitoring program specified in this permit without an approved permit modification pursuant to Permit Condition I.J.

iii. If a groundwater monitoring well is damaged, the Permittee shall immediately notify the Department in writing, which includes a description of the well repair activities to be conducted. The well repair procedures must be approved by the Department prior to implementation. Within 30 calendar days after the well is repaired, the Permittee shall submit a written notification to the Department that the well repair activities were conducted in accordance with the approved procedures.

iv. If a groundwater monitoring well is deleted from the monitoring program(s) required by this permit in accordance with Permit Conditions III.B.1.a.ii. and I.J., it shall be abandoned within 90 calendar days after deletion using procedures to be approved by the Department. Within 30 calendar days after the well is abandoned, the Permittee shall submit a

DRAFT

written notification to the Department that the well abandonment activities were conducted in accordance with the approved procedures.

b. Groundwater monitoring wells RC-1, RC-1A, RC-2, RC-2A, RC-3, RC-3A, RW-1, and RW-2 shall define the point of compliance for the Aeration Pond, Vacuum Ponds, Sand Filtration Beds, and the Container Storage Area, which were all closed as a single landfill.

c. The Permittee shall maintain groundwater monitoring well UG-2 as the background monitoring well for the entire facility as specified in Attachment P of the permit application.

d. The Permittee shall install and maintain additional groundwater monitoring wells as necessary to assess changes in the rate and extent of any plume of contamination or as otherwise deemed necessary to maintain compliance with ADEM Admin. Code Rules 335-14-5-.06(6), 335-14-5-.06(8), 335-14-5-.06(9), 335-14-5-.06(10), and 335-14-5-.06(11), as applicable. A plan in the form of a permit modification request specifying the design, location and installation of any additional monitoring wells should be submitted to the Department at least 90 calendar days prior to installation which, at a minimum, shall include:

   i. Well construction techniques including casing depths and proposed total depth of well(s);

   ii. Well development method(s);

   iii. A complete description of well construction materials;

   iv. A schedule of implementation for construction; and,

   v. Provisions for determining the lithologic characteristics, hydraulic conductivity, grain size distribution, and porosity for the applicable aquifer unit(s) at the location of the new well(s).

e. The Permittee shall install and/or designate wells AS-3 and AS-4 as recovery wells within 90 days of the effective date of this permit. The well construction and location will follow the specifications shown in Attachment R of the permit application. After the installation of these wells is completed, and within 120 calendar days after the effective date of this permit, the Permittee shall submit a report to the Department that includes the surveyed location and elevation, surveyed elevation reference point, total depth, screened interval, well log, and other pertinent information for each well installed. All location and elevation data shall be surveyed by a professional surveyor licensed in the State of Alabama. Elevation data shall be recorded and reported as mean sea level (MSL) and referenced to an appropriate national geodetic vertical datum (NGVD) benchmark. Location data shall include latitude and longitude. The report shall be accompanied by a request for a minor permit modification in accordance with ADEM Admin Code Rule 335-14-8-.04(3) and Permit Condition I.J.

DRAFT

f. The Permittee shall abandon well(s) AS-1, AS-2, AS-5, AS-6, AS-7, AS-8, AS-9, AS-10, RW-20, RW-21, RW-23, RW-24, RW-25, RW-28, RW-29, RW-30, RW-31, RW-32, RW-33, and RW-34, using procedures to be approved by the Department, within 90 calendar days after the effective date of this permit. After the abandonment of these wells is completed, and within 120 calendar days after the effective date of this permit, the Permittee shall submit a report to the Department which includes a detailed description of the well abandonment activities conducted.

2. General Groundwater Monitoring Requirements

a. The Permittee shall determine the groundwater surface elevation from all monitoring wells listed in Table III.1. of this permit at least annually and each time a sampling event is conducted. The results of these determinations should be submitted in accordance with Permit Condition III.B.6. Elevation data should be recorded and reported as mean sea level (MSL) and referenced to an appropriate national geodetic vertical datum (NGVD) benchmark.

b. The Permittee shall determine the groundwater flow rate and direction in the underlying aquifer(s) at least annually and submit the results in accordance with Permit Condition III.B.6.

c. The Permittee shall determine background concentrations of hazardous constituents and other chemical parameters required to be monitored by this permit in accordance with Attachment P of the permit application and ADEM Admin. Code Rule 335-14-5-.06(8)(g).

3. Groundwater Protection Standard

a. The groundwater protection standard, as required under ADEM Admin. Code Rule 335-14-5-.06(3), shall consist of Table III.3 of this permit which lists the hazardous constituents and their respective concentration limits.

b. The groundwater protection standard applies to all hazardous waste or hazardous constituent releases as deemed appropriate by the Department to protect human health and the environment.

4. Compliance Period

a. The compliance period, during which the groundwater protection standard specified in Permit Condition III.B.3. applies, shall begin at the time of the first sampling event of the compliance monitoring program (Permit Condition III.D.), or the corrective action monitoring program (Permit Condition III.E.), whichever is earlier.

b. The compliance period shall continue (after beginning pursuant to Permit Condition III.B.4.a.) until the groundwater protection standard as defined by Permit Condition III.B.3.a. has not been exceeded for a period of three consecutive years.

DRAFT

c. If the Permittee is engaged in a corrective action program pursuant to Permit Condition III.E., then the compliance period shall continue as required by ADEM Admin. Code Rule 335-14-5-.06(7)(c) until the groundwater protection standard has not been exceeded for a period of three consecutive years after corrective action has been terminated and this permit has been modified, in accordance with Permit Condition I.J., to implement a compliance monitoring program pursuant to Permit Condition III.D. or a detection monitoring program pursuant to Permit Condition III.C., as required by ADEM Admin. Code Rule 335-14-5-.06(11)(f).

5. Sampling and Analysis Procedures

The Permittee shall use the following techniques and procedures when obtaining and analyzing samples from the groundwater monitoring wells described in Permit Condition III.B.1. to provide a reliable indication of the quality of the groundwater as required under ADEM Admin. Code Rules 335-14-5-.06(8)(d), (e), and (g):

a. Samples shall be collected, preserved, and shipped (when shipped off-site for analysis) in accordance with the procedures specified in Attachment P of the permit application.

b. Samples shall be analyzed according to the procedures specified in Attachment P of the permit application, the most recent edition of SW-846 or other appropriate methods approved by the Department. Analytical method detection limits shall be less than, or equal to the groundwater protection standards specified in Table III.3., unless otherwise approved in writing by the Department.

c. Samples shall be tracked and controlled using the chain-of-custody procedures specified in Attachment P of the permit application.

d. Statistical analyses used to evaluate the groundwater monitoring data shall be as described in Attachment P of the permit application and ADEM Admin. Code Rule 335-14-5-.06(8)(h).

e. All samples taken in accordance with this permit shall not be filtered prior to analysis.

6. Recordkeeping and Reporting

a. The Permittee shall keep and maintain all monitoring, testing, and analytical data obtained in accordance with Permit Conditions III.B., III.C., III.D., and III.E. as required by Permit Condition I.C.10.

b. The Permittee shall submit to the Department a written report to include all analytical sampling data, established background values, statistical evaluations, groundwater elevations, associated potentiometric maps, and the annual groundwater flow rate and direction determinations. The analytical method and the method detection limit (MDL) for each constituent must be integrated into all reports of analysis. The report shall be submitted within 60 calendar days after the first sampling event and on an annual basis thereafter. Copies of this report shall be kept at the facility in accordance with Permit Conditions I.C.10.c. and I.C.10.e.

DRAFT

c. The Permittee shall submit progress reports to the Department describing implementation of groundwater monitoring and/or corrective action activities at the site as required by Part III of this permit on a quarterly basis. The first progress report shall be submitted to the Department within 90 calendar days after the effective date of this permit. The progress reports shall continue until such time as the required monitoring and/or corrective action systems and activities required by this permit are fully constructed and operational. In the event that additional monitoring and/or corrective action requirements are imposed through a permit modification, in accordance with Permit Condition I.J., the quarterly reporting requirement shall resume, commencing upon the effective date of the permit modification and continuing until the required monitoring and/or corrective action systems and activities are again fully constructed and operational.

III.C. DETECTION MONITORING PROGRAM [RESERVED]

III.D. COMPLIANCE MONITORING PROGRAM [RESERVED]

III.E. CORRECTIVE ACTION MONITORING PROGRAM

The requirements of this Condition are applicable to the entire facility. Except as specified otherwise in this permit, the Corrective Action Monitoring Program shall be implemented in accordance with Attachment R of the permit application and ADEM Admin. Code Rule 335-14-5-.06(11).

1. Monitoring Systems

In addition to the point of compliance and background well monitoring systems identified in Permit Conditions III.B.1.b. and III.B.1.c., the Permittee shall:

a. Maintain groundwater monitoring wells E-2, RW-3B, RW-8A, B-24, B-25, B-36, B-60A, B-65, B-97, B-101, B-108A, and B-128 as boundary wells for the entire facility as specified in Table III.1. of this permit and as shown on Figure P-1 of the permit application.

b. Maintain groundwater monitoring wells E-1, RW-3A, RW-4, RW-5, T-1, and T-2 as effectiveness wells as specified in Table III.1. of this permit and as shown on Figure P-1 of the permit application.

c. Maintain wells A-1, A-2, A-3, A-4, A-5, A-6, AS-3, AS-4 , E-1, GC SUMP, CO-7, CO-10, RC-2, RC-3, RW-1, RW-2, RW-3A, RW-3B, RW-4, RW-5, RW-6, RW-7, RW-8, RW-8A, RW-9, RW-10, RW-11, RW-12, RW-13, RW-18, RW-19, RW-35, RW-36, RW-37, T-1, and T-2 as recovery wells and maintain wells A-1, A-2, A-3, A-4, A-5, A-6, I-1, I-2A, I-3, and B-48A, as injection wells as specified in Table III.1. of this permit and as shown on Figure P-1 of the permit application.

DRAFT

d. Maintain wells RC-1, RC-1A, RC-2, RC-2A, RC-3, RC-3A, RW-1, and RW-2 as point of compliance wells as specified in Table III.1. of this permit and as shown on Figure P-1 of the permit application

2. Corrective Action Program

a. The Permittee shall conduct a Corrective Action Program, as described in Attachment R of the permit application, to remove or treat in place all hazardous constituents that exceed their respective groundwater protection standards as described in Table III.3. of this permit at the point of compliance, between the point of compliance and the down-gradient facility property boundary, and beyond the facility boundary in accordance with ADEM Admin. Code Rule 335-14-5-.06(11)(e).

b. Pursuant to ADEM Admin. Code Rules 335-14-5-.06(11)(c) and 335-14-5-.06(11)(e)3., the Permittee shall continue to implement the corrective action program as described in Attachment R of the permit application within 120 calendar days after the effective date of this permit.

c. The Permittee shall handle/treat groundwater in accordance with Attachment R of the permit application and with the applicable requirements of NPDES and UIC permit number(s) AL0001104 and ALSI 9949454 respectively, as issued by the Department.

3. Monitoring Requirements

In addition to the general groundwater monitoring requirements specified in Permit Condition III.B.2., the Permittee shall:

a. Sample all point of compliance, effectiveness, and boundary monitoring wells shown in Table III.1. of this permit and analyze for the constituents listed in Table III.2. of this permit on a semi-annual basis beginning within 120 calendar days of the effective date of this permit and continuing through the end of the compliance period.

b. Sample all background, point of compliance, effectiveness, and boundary monitoring wells shown in Table III.1. of this permit and analyze for the constituents listed in Table III.2. of this permit on an annual basis beginning within 120 calendar days of the effective date of this permit and continuing through the end of the compliance period.

c. Sample all background, point of compliance, effectiveness, and boundary monitoring wells shown in Table III.1. of this permit and analyze for temperature (degrees F or C), specific conductance (Mhos/cm), and pH (standard units) each time the well is sampled. The data obtained should be submitted as raw data in the reports required by Permit Condition III.B.6.

d. When evaluating the monitoring results to determine the effectiveness of the corrective measures, in accordance with Permit Condition III.E.4., the Permittee shall:

DRAFT

i. Determine if the corrective action system effectively addresses the entire plume of contamination;

ii. Determine if the concentration of the hazardous constituents are decreasing (pH increasing or decreasing toward neutrality, as applicable) in the effectiveness wells specified in Permit Condition III.E.1.;

iii. Determine if hazardous waste or hazardous constituents are being released into the environment; and

iv. Determine if hazardous constituents have been detected in the boundary wells specified in Permit Condition III.E.1.

4. Reporting and Response Requirements

In addition to the recordkeeping and reporting requirements specified in Permit Condition III.B.6.:

a. The Permittee shall report the effectiveness of the corrective action program annually, as required under ADEM Admin. Code Rule 335-14-5-.06(11)(g). These reports shall be submitted to the Department within 60 calendar days of each annual anniversary of this permit after corrective action is initiated and continue until corrective action is completed. The Permittee must provide data from groundwater monitoring along with an analysis of that data and any conclusions regarding the effectiveness of the program in accordance with Permit Condition III.E.3.d. If the analysis of the data warrants any change to the corrective action program, the Permittee must include these revisions in the annual report which will be followed up within 90 calendar days with an application for permit modification in accordance with Permit Condition I.J.

b. If corrective action is terminated under Permit Condition III.B.4.c., the Permittee must sample all background, point of compliance, effectiveness and boundary sampling locations for the compounds listed in ADEM Admin. Code Rule 335-14-5-Appendix IX. Based upon the sampling results, the Permittee may petition the Department, in accordance with Permit Condition I.J, for a permit modification to implement either a detection monitoring program or a compliance monitoring program.

PART IV

SOLID WASTE MANAGEMENT UNIT IDENTIFICATION AND EVALUATION

IV.A. APPLICABILITY

The Conditions of this Part apply to:

1. The solid waste management units (SWMUs) and areas of concern (AOCs) identified in Table IV.1, which require investigation and/or remediation;

2. The SWMUs identified in Table IV.2, which require no further action under this permit at this time;

3. Any additional SWMUs or AOCs discovered during the course of groundwater monitoring, field investigations, environmental audits, or other means; and,

4. Contamination beyond the facility boundary, if applicable. The Permittee shall implement corrective actions beyond the facility boundary where necessary to protect human health and the environment, unless the Permittee demonstrates to the satisfaction of the Department that, despite the Permittee's best efforts, as determined by the Department, the Permittee was unable to obtain the necessary permission to undertake such actions. The Permittee is not relieved of all responsibility to clean up a release that has migrated beyond the facility boundary where off-site access is denied. On-site measures to address such releases will be determined on a case-by-case basis. Assurances of financial responsibility for completion of such off-site corrective action will be required.

IV.B. NOTIFICATION AND ASSESSMENT REQUIREMENTS FOR NEWLY IDENTIFIED SWMUs AND AOCs

1. The Permittee shall notify the Department in writing, within 15 calendar days of discovery, of any additional AOC(s) as described under Permit Condition IV.A.3. The notification shall include, at a minimum, the location of the AOC(s) and all available information pertaining to the nature of the release (*e.g.,* media affected, hazardous constituents released, magnitude of release, *etc.*). If the Department determines that further investigation of an AOC is required, the permit will be modified in accordance with ADEM Admin. Code r. 335-14-8-.04(2).

2. The Permittee shall notify the Department in writing, within 15 calendar days of discovery, of any additional SWMUs as described under Permit Condition IV.A.3.

3. The Permittee shall prepare and submit to the Department, within 90 calendar days of notification, a SWMU Assessment Report (SAR) for each SWMU identified under Permit Condition IV.B.2. At a minimum, the SAR shall provide the following information:

   a. Location of unit(s) on a topographic map of appropriate scale such as required under ADEM Admin. Code r. 335-14-8-.02(5)(b)19.

DRAFT

b. Designation of type and function of unit(s).

c. General dimensions, capacities and structural description of unit(s) (supply any available plans/drawings).

d. Dates that the unit(s) was operated.

e. Specification of all wastes that have been managed at/in the unit(s) to the extent available. Include any available data on hazardous constituents in the wastes.

f. All available information pertaining to any release of hazardous waste or hazardous constituents from such unit(s) (to include groundwater data, soil analyses, air, and/or surface water data).

4. Based upon the results of the SAR, the Department shall determine the need for further investigations at the SWMUs covered in the SAR. If the Department determines that such investigations are needed, the Permittee shall initiate an investigation as outlined in Permit Condition IV.D.1 immediately upon receiving notification of the Department's determination.

IV.C. NOTIFICATION REQUIREMENTS FOR NEWLY DISCOVERED RELEASES AT PREVIOUSLY IDENTIFIED SWMUs or AOCs

1. The Permittee shall notify the Department in writing of any newly discovered release(s) of hazardous waste or hazardous constituents discovered during the course of groundwater monitoring, field investigations, environmental audits, or other means, within 15 calendar days of discovery. Such newly discovered releases may be from SWMUs or AOCs identified in Permit Condition IV.A.3 or SWMUs or AOCs identified in Permit Condition IV.A.2 for which further investigation was not required.

2. If the Department determines that further investigation of the SWMUs or AOCs is needed, the Permittee shall initiate an investigation as outlined in Permit Condition IV.D. immediately upon receiving notification of the Department's determination.

IV.D. RCRA FACILITY INVESTIGATION (RFI)

1. The Permittee must perform an RFI for any SWMU and AOC identified by the Department in accordance with Permit Conditions IV.A.1, IV.B.4, and IV.C.2.

2. The RFI must completely identify the concentration of hazardous constituents released from each SWMU and AOC and fully delineate the area where such hazardous constituents have come to be located.

3. The RFI must fully characterize the nature and extent of contamination released from each SWMU or AOC under investigation.

4. The RFI must be performed in a manner consistent with the most recent edition of the Alabama Environmental Investigation and Remediation Guidance (AEIRG).

DRAFT

5. Except as provided by Permit Condition IV.D.6., the RFI must be completed within 180 calendar days from the effective date of this permit or, for SWMUs or AOCs identified pursuant to Permit Condition IV.B. and C., within 180 calendar days from the receipt of notification from the Department that an RFI is required. If, prior to the effective date of this permit, the Department has approved a work plan that includes a schedule for completing the RFI, the RFI shall be completed in accordance with the approved schedule.

6. RFI Schedule of Compliance

   a. For RFIs expected to require greater than 180 calendar days to complete, the Permittee may submit a schedule of compliance subject to Departmental approval and/or modification.

   b. Submittal of an RFI Schedule of Compliance does not delay or otherwise postpone the Permittee's obligation to initiate the RFI.

   c. The Schedule of Compliance must include:

      i. A detailed narrative discussion, which explains why the RFI cannot be completed within 180 days; and,

      ii. A detailed and chronological listing of milestones with estimated durations that provides sufficient information to track the progress of the investigation.

   d. The RFI Schedule of Compliance shall be reviewed by the Department in accordance with Permit Condition IV.G.

   e. The Permittee shall complete the RFI in accordance with the approved RFI Schedule of Compliance.

7. RFI Progress Reports

   a. For an RFI being conducted in accordance with the approved RFI Schedule of Compliance, the Permittee must submit progress reports on a monthly basis.

   b. The RFI Progress Reports must include:

      i. A description of the RFI activities completed during the reporting period;

      ii. Summaries of any problems or potential problems encountered during the reporting period;

      iii. Actions taken to rectify problems;

      iv. Changes in relevant personnel;

      v. Projected work for the next reporting period;

DRAFT

vi. Any proposed revisions to the RFI Schedule of Compliance. Modifications of the RFI Schedule of Compliance are subject to approval by the Department; and,

vii. A summary of any data collected during the reporting period, including:

A. The location of each sampling point identified on a site map; and

B. The concentration of each hazardous constituent detected at each sampling point;

c. Submittal of RFI Progress Reports, work plans, or other documents during the RFI does not alter the approved RFI Schedule of Compliance.

8. RFI Reports

a. The Permittee shall prepare and submit to the Department an RFI Report within 60 calendar days from the completion of investigation activities in accordance with the approved RFI Schedule of Compliance, if applicable.

b. The RFI Report must provide a detailed description of all required elements of the investigation as described in the most recent edition of the AEIRG.

c. The RFI Report shall be reviewed by the Department in accordance with Permit Condition IV.G.

IV.E. SELECTION OF CORRECTIVE MEASURES AND PERMIT MODIFICATION

1. The Permittee shall develop and submit to the Department a Corrective Measures Implementation (CMI) Plan for any areas of the Permittee's site where hazardous constituents have come to be located at concentrations exceeding those appropriate for the protection of human health and the environment. The CMI Plan must include all applicable elements of the proposed remedy pursuant to the most recent edition of the AEIRG.

2. The CMI Plan shall be submitted to the Department within 120 calendar days following the Permittee's submittal of the RFI Report indicating that hazardous constituents have come to be located at any area of the Permittee's facility, or beyond the facility, at concentrations exceeding those appropriate for the protection of human health and the environment, or within 120 calendar days following notification from the Department that a CMI Plan is required, whichever occurs earlier.

3. The CMI Plan shall be submitted along with a request for permit modification pursuant to ADEM Admin. Code r. 335-14-8-.04(2), and shall include any applicable fees pursuant to ADEM Admin. Code Chapter 335-1-6. This modification will serve to incorporate the proposed final remedy, including all procedures necessary to implement and monitor the remedy, into this permit.

4. Within 60 calendar days after this Permit has been modified in accordance with Permit Condition IV.E.3., the Permittee shall demonstrate financial assurance for completing the approved remedy.

DRAFT

IV.F. INTERIM MEASURES (IM)

1. IM Work Plan(s)

   a. Upon notification by the Department, the Permittee shall prepare and submit an Interim Measures (IM) Work Plan for any SWMU or AOC that the Department determines is necessary. IM are necessary in order to minimize or prevent further migration of contaminants and limit human and environmental exposure to contaminants while long-term corrective measures are evaluated and, if necessary, implemented. The IM Work Plan shall be submitted within 30 calendar days of such notification and shall include the elements listed in Permit Condition IV.F.1.b. Such IM may be conducted concurrently with investigations required under the terms of this permit. The Permittee may initiate IM by submitting an IM Work Plan for approval and reporting in accordance with the requirements under Permit Condition IV.F.

   b. The IM Work Plan shall ensure that the IM are designed to mitigate any current or potential threat(s) to human health or the environment and is consistent with and integrated into any long-term solution at the facility. The IM Work Plan shall include: the IM objectives, procedures for implementation (including any designs, plans, or specifications), and schedules for implementation.

   c. The IM Work Plan must be approved by the Department, in writing, prior to implementation. The Department shall specify the start date of the IM Work Plan schedule in the letter approving the IM Work Plan.

   d. The IM Report shall be reviewed by the Department in accordance with Permit Condition IV.G.

2. IM Implementation

   a. The Permittee shall implement the IM in accordance with the approved IM Work Plan.

   b. The Permittee shall give notice to the Department as soon as possible of any planned changes, reductions or additions to the IM Work Plan.

   c. Final approval of corrective action required under ADEM Admin. Code r. 335-14-5-.06(12), which is achieved through IM, shall be in accordance with ADEM Admin. Code r. 335-14-8-.04(2) and Permit Condition IV.E.

3. IM Reports

   a. If the time required for completion of IM is greater than one year, the Permittee shall provide the Department with Progress Reports at intervals specified in the approved work plan. The Progress Reports shall, at a minimum, contain the following information:

      i. A description of the portion of the IM completed;

DRAFT

ii. Summaries of any deviations from the IM Work Plan during the reporting period;

iii. Summaries of any problems or potential problems encountered during the reporting period;

iv. Projected work for the next reporting period; and,

v. Copies of laboratory or monitoring data.

b. The Permittee shall prepare and submit the IM Report to the Department within 90 calendar days of completion of IM conducted under Permit Condition IV.F. The IM Report shall, at a minimum, contain the following information:

i. A description of IM implemented;

ii. Summaries of results;

iii. Summaries of all problems encountered;

iv. Summaries of accomplishments and/or effectiveness of IM; and,

v. Copies of all relevant laboratory or monitoring data, *etc.*, in accordance with Permit Condition I.C.10.

DRAFT

IV.G. SUBMITTALS

1. All work plans, reports, schedules, and other documents ("submittals") required by this permit shall be subject to approval by the Department to assure that such submittals and schedules are consistent with the requirements of this Permit and with applicable regulations and guidance. The Permittee shall revise all submittals and schedules as directed by the Department.

2. The Department will review all submittals in accordance with the conditions of this permit. The Department will notify the Permittee in writing of any submittal that is disapproved, and the basis thereof. If the Department disapproves a submittal, the Department shall: (1) notify the Permittee in writing of the submittal's deficiencies and specify a due date for submission of a revised submittal, (2) revise the submittal and notify the Permittee of the revisions, or (3) conditionally approve the submittal and notify the Permittee of the conditions. Permit Condition IV.H. shall apply only to submittals that have been disapproved and revised by the Department, or that have been disapproved by the Department, then revised and resubmitted by the Permittee, and again disapproved by the Department.

3. All submittals shall be submitted within the time frame specified by the Department and in accordance with the approved schedule of compliance. Extensions of the due date for submittals may be granted by the Department based on the Permittee's demonstration that sufficient justification for the extension exists.

4. All submittals required by this permit shall be signed and certified in accordance with ADEM Admin. Code r. 335-14-8-.02(2).

5. Two (2) copies of all submittals shall be provided by the Permittee to the Department in accordance with Permit Condition I.K.

IV.H. DISPUTE RESOLUTION

Notwithstanding any other provision in this permit, in the event the Permittee disagrees, in whole or in part, with the Department's revision of a submittal or disapproval of any revised submittal required by this Part, the following may, at the Permittee's discretion, apply:

1. In the event that the Permittee chooses to invoke the provisions of this section, the Permittee shall notify the Department in writing within 30 calendar days of receipt of the Department's revision of a submittal or disapproval of a revised submittal. Such notice shall set forth:

   a. The specific matters in dispute;

   b. The position the Permittee asserts should be adopted as consistent with the requirements of this permit;

   c. The basis for the Permittee's position; and,

   d. Any matters considered necessary for the Department's determination.

2. The Department and the Permittee shall have an additional 30 calendar days from the Department's receipt of the notification provided for in Permit Condition IV.H.1. to meet or confer to resolve any disagreement.

3. In the event agreement is reached, the Permittee shall submit and implement the revised submittal in accordance with and within the time frame specified in such agreement.

4. If agreement is not reached within the 30-day period, the Department will notify the Permittee in writing of the decision on the dispute, and the Permittee shall comply with the terms and conditions of the Department's decision in the dispute. For the purposes of this provision in this permit, the responsibility for making this decision shall not be delegated below the Department’s Land Division Chief.

5. With the exception of those conditions under dispute, the Permittee shall proceed to take any action required by those portions of the submission and of this permit that the Department determines are not affected by the dispute.

DRAFT

List of SWMUs and AOCs requiring no further action at this time (cont.):

SWMU/AOC NUMBER	SWMU/AOC NAME	UNIT COMMENT	POTENTIALLY AFFECTED MEDIA
10A	Collection Tanks	Above Ground Tanks/ Removed and placed in SWMU 1	Soil, groundwater
10B	Collection Tanks	Above Ground Tanks/ Removed and placed in SWMU 1	Soil, groundwater
11	Barometric Condenser	Removed and placed in SWMU 1	Soil, groundwater
13	Flocculation Tank	Above Ground Tank	Soil, groundwater
15	Aeration Tank	Above Ground Tank	Soil, groundwater
17	Former NPDES Drainage Ditch	Soil excavated and placed in landfill	Soil, groundwater
18	Creosote Wastewater Disposal Area	Marsh	Soil, groundwater
19	Treated Lumber Waste Pile	Waste placed in SWMU 1; Soil excavated and treated in on-site Corrective Action Management Unit (CAMU)	Soil, groundwater
20	Satellite Accumulation Areas	Waste sent off-site; Soil excavated and treated in CAMU	Soil, groundwater
22	North Tar Deposit	Waste Pile/ Removed and placed in SWMU 1	Soil, groundwater
23	Creek Tar Deposit	Waste Pile/ Removed and placed in SWMU 1	Soil, groundwater
24A	Spot Deposit	Waste Pile/ Removed and placed in SWMU 1	Soil, groundwater
24B	Spot Deposit	Waste Pile/ Removed and placed in SWMU 1	Soil, groundwater
24C	Spot Deposit	Waste Pile/ Removed and placed in SWMU 1	Soil, groundwater
25	Former Conical Burner	Incinerator/ Removed prior to RCRA unit closure	Ambient air
26	BFI Dumpster	Dumpster	Soil, groundwater
27	New Area Behind Tank Farm	Pond/ Soil excavated and treated in CAMU	Soil, groundwater
28	Scrap Debris Holding Area	Scrap waste/ In service	Soil, groundwater
29	Current Groundwater Treatment System	In service	None
AOC A	Former Treated Wood Storage	Drippage from treated wood/ Soil excavated and treated in CAMU	Soil, groundwater
AOC B	DG-1A Monitoring Well Plume	Low level of contaminants observed in monitoring well/ Ongoing monitoring	Groundwater
AOC C	Former Oil Pipeline Site	Soil excavated and treated in CAMU	Soil, groundwater
AOC D	Three Mile Creek	Stormwater runoff and NPDES discharge	Soil, groundwater, surface water
AOC E	Former UST Location	Within SWMU 1 capped area	Soil, groundwater
AOC F	Former Working Tank No. 2	Removed and placed in SWMU 1	Soil, groundwater
AOC G	Eastern Drainage Ditch	Stormwater runoff/ Soil excavated and treated in CAMU	Soil, groundwater
AOC H	Culvert	Culvert/ Soil excavated and treated in CAMU	Soil, groundwater

DRAFT

Table IV.3

The following Solid Waste Management Unit(s) (SWMU) and/or Area(s) of Concern (AOC) numbers and descriptions correspond with those noted in the RCRA Facility Assessment (RFA) Report. Where discrepancies exist, the permit will take precedence.

List of SWMUs and AOCs regulated by Parts I, II, and III of this permit.

SWMU/AOC NUMBER	DESCRIPTION	UNIT COMMENT	POTENTIALLY AFFECTED MEDIA
1	Capped Landfill Unit	Capped Landfill Unit, approximately 160,000 ft2	Soil, groundwater
12	Vacuum Ponds*	Cooling Ponds	Soil, groundwater
14	Sand Filtration Beds (2)*	Drying Beds	Soil, groundwater
16	Aeration Pond*	Wastewater Treatment Pond	Soil, groundwater
21	Container Storage Area*	Drum Storage	Soil, groundwater

*closed as one landfill unit (SWMU 1)

DRAFT

PART V

CORRECTIVE MEASURES IMPLEMENTATION

V.A. APPLICABILITY

The conditions of this Part apply to SWMUs and AOCs identified in Table V.1.

V.B. GENERAL CONDITIONS

1. The Permittee is required to perform corrective measures for the SWMUs and AOCs identified in Condition V.A. The approved remedy for these defined units, waterway areas, or land parcels, includes any and all actions set forth in this permit and in the approved Interim Measures Plans and Corrective Measures Implementation (CMI) Plans approved by the Department, as noted below:

Applicable SWMU/AOC	CMS/CMI	Approval Date
SWMUs 1, 12, 14, 16, and 21	Corrective Action Plan Addendum	XX XX, 2025

2. Remedial Cleanup Levels

   Upon approval, pursuant to Condition Section 16.2 of the permit application designating applicable cleanup level(s), the cleanup level(s) for the areas specific to the CMI Plan will be deemed to be a condition of this permit.

3. Groundwater Monitoring and Remediation

   Where required pursuant to Conditions V.B.1. and V.C. of this permit, the Permittee shall comply with the general groundwater monitoring requirements of Part III of this permit.

4. Land Use Controls

   Where required pursuant to Conditions V.B.1. and V.C. of this permit, the Permittee shall establish appropriate land use controls to achieve protection of human health and the environment. The Permittee shall comply with Conditions V.B.5. and V.B.6. of this permit when implementing corrective measures requiring land use controls. In the event an off-site property owner does not allow an environmental covenant to be imposed, the Permittee shall notify the Department within 14 calendar days of receipt of such written notification of the refusal by the off-site property owner. If the property owner does not provide a written refusal of the request to allow an environmental covenant to be imposed, the Permittee shall notify the Department within 14 days of delivery of the request to the off-site property owner. In such cases, the Department may allow the Permittee to propose an alternate area-specific land use control subject to the Department's review and approval.

DRAFT

5. Survey Plat

For corrective measures where residual concentrations of contaminants will remain in-place at levels greater than those appropriate for unrestricted land use, or for corrective measures that rely on land use controls, the Permittee must:

a. Within 90 calendar days following the effective date of a permit modification addressing remedy selection, submit to the local zoning authority, or the authority with jurisdiction over local land use, and to the Department, a survey plat indicating the location and dimensions of the SWMUs, AOCs, and capped or partially remediated areas with respect to permanently surveyed benchmarks, the locations of sampling points, and the concentrations of hazardous constituents detected. This plat must be prepared and certified by a professional land surveyor registered in the State of Alabama. The plat must be filed with the local zoning authority or the authority with jurisdiction over local land use and must contain a note, prominently displayed, which states the Permittee's obligation to limit the property to the specified restricted uses.

b. Maintain the survey plat as described in Condition V.B.5.a. of this permit and in the Attachment I of the permit application until the Permittee has demonstrated, to the satisfaction of the Department, that the levels of hazardous constituents in all contaminated media are within limits appropriate for unrestricted land uses.

6. Environmental Covenant

No later than the submission of the survey plat required in Condition V.B.5., the Permittee must:

a. Record in the probate judge’s office of the county in which the property, or a portion thereof, is located an environmental covenant in accordance with ADEM Admin. Code Division 335-5 that will in perpetuity notify any potential purchaser of the property that:

i. The land is contaminated with hazardous constituents in concentrations that exceed unrestricted use standards;

ii. The use of the property is restricted by this permit for certain residential, municipal, or industrial purposes and may lead to an increased risk of exposure to hazardous constituents depending upon the activities initiated at the site. Such activities may yield an increased level of human health risk to the owner;

iii. The potential purchaser or entity that desires to work in the contaminated area should notify the Permittee before mobilizing to the area covered by the land use control.

b. Submit to the Department a certification, signed by the Permittee in accordance with Permit Condition I.C.11., that the environmental covenant specified in this part has been performed. This certification must include a copy of the document in which the notation has been placed.

DRAFT

c. Maintain the environmental covenant described in Permit Condition V.B.6. until the Permittee has demonstrated, to the satisfaction of the Department, that the levels of hazardous constituents in all contaminated media are within limits appropriate for unrestricted land uses.

7. Security

Security measures, where required by Conditions V.B.1. and V.C. of this permit, will be conducted in accordance with ADEM Admin. Code r. 335-14-5-.02(5) and as prescribed in the approved CMI Plan.

8. Inspection

Where corrective measures addressed in Conditions V.B.1. include provisions to cap in place or partially remediate properties or land areas, whether owned or not owned by the Permittee, the Permittee shall specify inspection protocols on a scheduled basis to ensure continued integrity of the remedy and to ensure that land use remains appropriately restricted per the environmental covenant established pursuant to Permit Condition V.B.6. Inspection provisions shall be as prescribed in the approved CMI Plan

V.C. AREA SPECIFIC CONDITIONS (RESERVED)

V.D. CORRECTIVE MEASURES IMPLEMENTATION (CMI) REPORTS

1. CMI Progress Reports

If the time required to complete implementation of a specific set of corrective measures, as described in the Department-approved CMI Plan, is greater than 180 calendar days, the Permittee shall provide ADEM with progress reports according to the schedule in the ADEM-approved CMI Plan. If no schedule has been approved as part of the associated plan, progress reports shall be submitted at least quarterly. The progress reports shall, at a minimum, contain the following information:

a. A description of the portion of CMI Plan completed;

b. Summaries of and deviations from the approved CMI Plan during the reporting period;

c. Summaries of current and potential problems, including recommended solutions and alternatives as well as corrective actions undertaken;

d. Any monitoring data (soil, air, dust, water) collected for any reason during the construction period for the purposes of monitoring potential for human and ecological exposure; and,

d. Projected work for the next period and impacts to the approved schedule.

DRAFT

2. Final CMI Reports

Upon completion of construction of corrective measures systems, implementation of land use controls, interim removal actions, or other short-term activities required by this permit and/or the approved CMI Plan, the Permittee shall submit to the Department a Final CMI Report containing, at a minimum, the following:

a. A description of activities completed;

b. For cap and cover remedies, as-built construction drawings presenting the final in-place three-dimensional location of contaminated material. A plan view of the remediated areas shall be presented in addition to a cross section of the in-place capped areas;

c. Waste manifests indicating the handling of any excavated material that has been shipped off-site to a Department-approved, certified landfill;

d. For remedies involving land use controls, a copy of the survey plat and environmental covenant required by Condition V.B. of this permit;

e. Monitoring data (soil, air, dust, water) collected for any reason during the construction period for the purposes of monitoring potential for human and ecological exposure; and,

f. Certification, prepared in accordance with ADEM Admin. Code r. 335-14-8-02 (2)(d) by the Permittee and an Alabama-registered independent professional engineer, that the corrective measures implementation phase (*i.e.,* construction) required by this permit is complete and that the approved system and/or facilities are ready for operation in accordance with the intended design (*i.e.,* CMI Plan).

3. Corrective Measures (CM) Effectiveness Reports

a. For corrective measures that have been fully implemented and where the corrective measures system(s) must operate for a period of time to achieve cleanup goals or levels, the Permittee shall submit CM Effectiveness Reports (addressing all Corrective Measures systems at the facility which are subject to this permit condition) annually, unless otherwise approved by the Department, beginning 180 calendar days following the Department's approval of the Final CMI Report for the initial Corrective Measures system subject to this permit condition. The overall CM Effectiveness Reports shall include, at a minimum, the following information for each SWMU and/or AOC included in the report:

i. A detailed narrative presenting an evaluation of the effectiveness of the selected remedy;

ii. Summaries of compliance with and progress toward achieving cleanup goals;

iii. Any significant revisions, adjustments, or proposed modifications to the selected remedy;

DRAFT

iv. Tabulated environmental sampling and monitoring data including, but not limited to, groundwater quality, elevation data, and a graphical representation of all constituents detected during each sampling event from recovery wells, monitoring wells, drinking water wells, and other locations;

v. Chain of custody, field reports, and laboratory data sheets to include the date of collection, the date the sample was extracted, and the date of sample analysis for samples collected during the reporting period;

vi. Any monitoring data (soil, air, dust, water) collected for any reason during the post-construction period for the purposes of monitoring potential for human and ecological exposure;

vii. Isoconcentration maps depicting the distribution of parameters for each sampling event;

viii. Time versus concentration plots for each monitoring parameter for each recovery well and a representative number of effectiveness wells;

ix. Tabulated volumetric data on groundwater pumped and pumping rates (monthly and cumulative) for each recovery well;

x. Records of any groundwater recovery system operation time, including shutdown periods, not including any minor (less than 24 hours) shutdowns for repairs, maintenance, etc.;

xi. Potentiometric surface maps;

xii. Description of land use during the reporting period at the designated area requiring corrective measures; and,

xiii. Findings of the Permittee's investigation into the continued effectiveness of land use controls per Condition V.B.

b. If, at any time, the Permittee determines that any remedy selection specified in Condition V.B or V.C. of this permit no longer satisfies the applicable requirements of ADEM Admin. Code r. 335-14-5-.06(12) or this permit for releases of hazardous waste or hazardous constituents originating from SWMUs or AOCs, the Permittee must, within 90 calendar days, submit an application for a permit modification, pursuant to Permit Condition I.J, to make any appropriate changes to the CMI Plan.

c. The application for changes in the CMI Plan, including changes in inspection and monitoring provisions of the CMI Plan, shall be submitted as an application for a permit modification pursuant to the requirements of ADEM Admin. Code r. 335-14-8-.04.

DRAFT

4. Final Report of Corrective Measures

Within 90 calendar days following attainment of cleanup levels or goals as outlined in this Permit and the approved CMI Plan, the Permittee shall submit to the Department a Final Report of Corrective Measures (FRCM). The FRCM shall contain a certification by the Permittee and an Alabama-registered independent professional engineer that all remedial measures required by this permit and the approved CMI Plan have been completed. The FRCM shall outline any procedures and schedules for dismantling of corrective measures systems, groundwater monitoring or recovery systems, removal of land use controls, and any other remedial systems or controls required by this permit or the approved CMI Plan.

DRAFT

Table V.1.

The following Solid Waste Management Unit(s) (SWMUs) and/or Area(s) of Concern (AOCs) numbers and descriptions correspond with those noted in the RCRA Facility Assessment (RFA) Report. Where discrepancies exist, the permit will take precedence.

List of SWMUs and AOCs requiring Corrective Measures.

SWMU/AOC NUMBER	DESCRIPTION	UNIT COMMENT	POTENTIALLY AFFECTED MEDIA
1	Capped Landfill Unit	Capped Landfill Unit, approximately 160,000 ft2	Soil, groundwater
12	Vacuum Ponds*	Cooling Ponds	Soil, groundwater
14	Sand Filtration Beds(2)*	Drying Beds	Soil, groundwater
16	Aeration Pond*	Wastewater Treatment Pond	Soil, groundwater
21	Container Storage Area*	Drum Storage	Soil, groundwater

*closed as one landfill unit (SWMU 1)

PART VI

SUMMARY OF DEADLINES

The summary information provided herein is intended only as a guide to the requirements of this permit. It is not intended to be all inclusive, nor is it intended to be used as a substitute for the full text of this permit.

PERMIT CONDITION	ITEM	DUE DATE
I.C.2.	Reapply for a renewal	180 calendar days before the expiration of the current permit.
I.C.12.a	Give notice to the Department of any planned physical alterations or additions to the permitted facility and any solid waste management units.	As soon as possible
I.C.12.f	Report any noncompliance with this permit that may endanger human health or the environment.	Orally within 24 hours from the time the Permittee becomes aware of the circumstances. Written submission shall also be provided within 5 calendar days of the time that the Permittee becomes aware of the circumstances
I.C.13	Submit the certification of construction.	Before the Permittee may commence treatment, storage or disposal of hazardous waste or contaminated media at any new or modified portion of the facility
I.G.	Waste Minimization Certification	Annually
I.H.	Update cost estimates	Annually, as required by ADEM Admin. Code Rules 335-14-5-.08(3)(b), 335-14-5-.08(5)(b), and 335-14-5-.08(10)(b) and no later than 30 calendar days after the Department has approved a modification to the Closure Plan, Post-Closure Plan, or Corrective Action Plan, or any other plan required or referenced by this permit, if the change in the plan results in an increase in the amount of the cost estimate.
I.J.	Submit a written request for a permit modification pursuant to the requirements of ADEM Admin. Code r. 335-14-8-.04(2).	At least 60 calendar days prior to a proposed change in facility design or operation.
II.C.2	Inspect closed unit(s).	At least monthly, after storms, and in accordance with the inspection schedule.
III.B.1.a.iii.	Notification of damaged groundwater monitoring wells.	Immediately in writing, which includes a description of the well repair activities to be conducted. The well repair procedures must be approved by the Department prior to implementation. A repair report must be submitted within 30 calendar days of repair.

DRAFT

PERMIT CONDITION	ITEM	DUE DATE
III.B.1.d.	Install additional groundwater monitoring wells	As necessary to assess changes in the rate and extent of any plume of contamination, or as otherwise deemed necessary. Note: a permit modification request must be submitted within 90 calendar days prior to installation of additional groundwater monitoring well(s).
III.B.1.e.	Install and/or designate wells AS-3 and AS-4 as recovery wells	Within 90 calendar days after the effective date of this permit. Submit report within 120 calendar days after the effective date of this permit. Submit well installation report within 30 calendar days after installation is completed.
III.B.1.f.	Abandon wells AS-1, AS-2, AS-5, AS-6, AS-7, AS-8, AS-9, AS-10, RW-20, RW-21, RW-23, RW-24, RW-25, RW-28, RW-29, RW-30, RW-31, RW-32, RW-33, and RW-34	Within 90 calendar days after the effective date of this permit. Submit report within 120 calendar days after the effective date of this permit.
III.B.2.a.	Determine groundwater surface elevation.	At least annually and each time a well is sampled.
III.B.2.b.	Determine groundwater flow rate and direction.	At least annually.
III.B.6.b.	Submit groundwater monitoring report	Within 60 calendar days of the first sampling event and annually thereafter.
III.B.6.c.	Submit progress reports.	Within 90 calendar days after the effective date of this permit and annually thereafter.
III.E.2.b.	Implement corrective action plan	No later than 120 calendar days after the effective date of this permit.
III.E.3.a.	Sample all point of compliance, effectiveness, and boundary wells and analyze for the constituents listed in Table III.2. of this permit.	Semi-annually beginning within 120 calendar days of the effective date of this permit.
III.E.3.b.	Sample all background, point of compliance wells, effectiveness, and boundary wells and analyze for the constituents listed in Table III.2. of this permit.	Annually beginning within 120 calendar days of the effective date of this permit.
III.E.3.c.	Sample all background, point of compliance, effectiveness, and boundary monitoring wells and analyze for temperature (degrees F or C), specific conductance (Mhos/cm), and pH (standard units).	Each time the well is sampled.
III.E.4.a.	Submit corrective action effectiveness reports.	Annually within 60 calendar days of each annual anniversary of this permit after corrective action is initiated and until corrective action is completed.

DRAFT

PERMIT CONDITION	ITEM	DUE DATE
IV.B.1.	Notify the Department, in writing, of the discovery of any additional AOCs	Within 15 calendar days of discovery
IV.B.2.	Notify the Department, in writing, of the discovery of any additional SWMUs	Within 15 calendar days of discovery
IV.B.3.	Submit a SWMU Assessment Report (SAR) for each SWMU identified under IV.B.2.	Within 90 calendar days of notification.
IV.C.1.	Notify the Department, in writing, of any newly discovered release(s) of hazardous waste or hazardous constituents from SWMUs or AOCs discovered during the course of groundwater monitoring, field investigations, environmental audits, or other means.	Within 15 calendar days of discovery
IV.D.7.	Submit RFI Progress Reports.	Monthly beginning in the second month following the initiation of the RFI
IV.D.8.	Submit RFI Report	Within 60 calendar days from the completion of investigation activities.
IV.E.2.	Submit CMI Plan	Within 120 calendar days following the Permittee's submittal of the RFI Report indicating that hazardous constituents have come to be located at any area of the Permittee's facility, or beyond the facility, at concentrations exceeding those appropriate for the protection of human health and the environment, or within 120 calendar days following notification from the Department that a CMI Plan is required, whichever occurs earlier.
IV.E.4.	Demonstrate financial assurance for completing the approved remedy.	Within 60 calendar days after this Permit has been approved.
IV.F.1.	Submit IM Work Plan	Within 30 calendar days upon notification by the Department.
IV.F.3.	Submit IM Report	Within 90 calendar days of completion of IM.
V.B.5.a.	Submit to the local zoning authority, or the authority with jurisdiction over local land use, and to the Department, a survey plat indicating the location and dimensions of the SWMUs, AOCs, and capped or partially remediated areas with respect to permanently surveyed benchmarks, the locations of sampling points, and the concentrations of hazardous constituents detected	Within 90 calendar days following the effective date of a permit modification addressing remedy selection.

DRAFT

PERMIT CONDITION	ITEM	DUE DATE
V.B.6.a.	Record environmental covenant	No later than the submission of the survey plat required in Condition V.B.5.
V.B.6.b.	Submit to the Department a certification that the environmental covenant has been performed.	No later than the submission of the plat required in Condition V.B.5.
V.D.3.	Submit Corrective Measures Effectiveness Reports	Annually beginning 180 calendar days following the Department's approval of the Final CMI Report
V.D.4.	Submit a Final Report of Corrective Measures	Within 90 calendar days following attainment of cleanup levels or goals

DRAFT

RCRA SUBTITLE C IDENTIFICATION FORM

United States Environmental Protection Agency
RCRA SUBTITLE C SITE IDENTIFICATION FORM

1. Reason for Submittal (Select only one.)

☐	Obtaining or updating an EPA ID number for on-going regulated activities (Items 10-17 below) that will continue for a period of time.
☐	Submitting as a component of the Hazardous Waste Report for _____ (Reporting Year)
	☐ Site was a TSD facility, a reverse distributor, and/or generator of ≥ 1,000 kg of non-acute hazardous waste, > 1 kg of acute hazardous waste, or > 100 kg of acute hazardous waste spill cleanup in **one or more months of the reporting year** (or State equivalent LQG regulations)
☐	Notifying that regulated activity is no longer occurring at this Site
☐	Obtaining or updating an EPA ID number for conducting Electronic Manifest Broker activities
☑	Submitting a new or revised Part A (permit) Form

2. Site EPA ID Number

A	L	D	0	5	7	2	2	6	9	0	4

3. Site Name

Cavenham Forest Industries LLC

4. Site Location Address

Street Address	**South End of Herbert Street**				
City, Town, or Village	**Mobile**			County	**Mobile**
State	**Alabama**	Country	**USA**	Zip Code	**36652**
Latitude	**30°43'50.92"N**	Longitude	**88° 2'56.97"W**	☑ Use Lat/Long as Primary Address	

5. Site Mailing Address ☐ Same as Location Street Address

Street Address	**P.O. Box 15369**				
City, Town, or Village	**Hattiesburg**				
State	**MS**	Country	**USA**	Zip Code	**39404**

6. Site Land Type

☑ Private ☐ County ☐ District ☐ Federal ☐ Tribal ☐ Municipal ☐ State ☐ Other

7. North American Industry Classification System (NAICS) Code(s) for the Site (at least 5-digit codes)

A. (Primary) **321114**	C.
B.	D.

8. Site Contact Information

☐ Same as Location Address

First Name **Collin**	MI **R**	Last Name **Creel**

10. Type of Regulated Waste Activity (at your site)

Mark "Yes" or "No" for all current activities (as of the date submitting the form); complete any additional boxes as instructed.

A. Hazardous Waste Activities

☑ Y ☐ N	1. Generator of Hazardous Waste—If "Yes", mark only one of the following—a, b, c	
☑	a. LQG	-Generates, in any calendar month, 1,000 kg/mo (2,200 lb/mo) or more of non-acute hazardous waste (includes quantities imported by importer site); or - Generates, in any calendar month, or accumulates at any time, more than 1 kg/mo (2.2 lb/mo) of acute hazardous waste; or - Generates, in any calendar month or accumulates at any time, more than 100 kg/mo (220 lb/mo) of acute hazardous spill cleanup material.
☐	b. SQG	100 to 1,000 kg/mo (220-2,200 lb/mo) of non-acute hazardous waste and no more than 1 kg (2.2 lb) of acute hazardous waste and no more than 100 kg (220 lb) of any acute hazardous spill cleanup material.
☐	c. VSQG	Less than or equal to 100 kg/mo (220 lb/mo) of non-acute hazardous waste.
☐ Y ☑ N	2. Short-Term Generator (generates from a short-term or one-time event and not from on-going processes). If "Yes", provide an explanation in the Comments section. *Note: If "Yes", you MUST indicate that you are a Generator of Hazardous Waste in Item 10.A.1 above.*	
☑ Y ☐ N	3. Treater, Storer or Disposer of Hazardous Waste—Note: Part B of a hazardous waste permit is required for these activities.	
☐ Y ☑ N	4. Receives Hazardous Waste from Off-site	
☐ Y ☑ N	5 Recycler of Hazardous Waste	
☐	a. Recycler who stores prior to recycling	
☐	b. Recycler who does not store prior to recycling	
☐ Y ☑ N	6. Exempt Boiler and/or Industrial Furnace—If "Yes", mark all that apply.	
☐	a. Small Quantity On-site Burner Exemption	
☐	b. Smelting, Melting, and Refining Furnace Exemption	

B. Waste Codes for Federally Regulated Hazardous Wastes. Please list the waste codes of the Federal hazardous wastes handled at your site. List them in the order they are presented in the regulations (e.g. D001, D003, F007, U112). Use an additional page if more spaces are needed.

K001						

C. Waste Codes for State Regulated (non-Federal) Hazardous Wastes. Please list the waste codes of the State hazardous wastes handled at your site. List them in the order they are presented in the regulations. Use an additional page if more spaces are needed.

11. Additional Regulated Waste Activities (NOTE: Refer to your State regulations to determine if a separate permit is required.)

A. Other Waste Activities

☐ Y ☑ N	1. Transporter of Hazardous Waste—If "Yes", mark all that apply.
☐	a. Transporter
☐	b. Transfer Facility (at your site)
☐ Y ☑ N	2. Underground Injection Control
☐ Y ☑ N	3. United States Importer of Hazardous Waste
☐ Y ☑ N	4. Recognized Trader—If "Yes", mark all that apply.
☐	a. Importer
☐	b. Exporter
☐ Y ☑ N	5. Importer/Exporter of Spent Lead-Acid Batteries (SLABs) under 40 CFR 266 Subpart G—If "Yes", mark all that apply.
☐	a. Importer
☐	b. Exporter

B. Universal Waste Activities

☐ Y ☑ N	1. Large Quantity Handler of Universal Waste (you accumulate 5,000 kg or more) - If "Yes" mark all that apply. Note: Refer to your State regulations to determine what is regulated.
☐	a. Batteries
☐	b. Pesticides
☐	c. Mercury containing equipment
☐	d. Lamps
☐	e. Aerosol Cans
☐	f. Other (specify) _____
☐	g. Other (specify) _____
☐ Y ☑ N	2. Destination Facility for Universal Waste Note: A hazardous waste permit may be required for this activity.

C. Used Oil Activities

☐ Y ☑ N	1. Used Oil Transporter—If "Yes", mark all that apply.
☐	a. Transporter
☐	b. Transfer Facility (at your site)
☐ Y ☑ N	2. Used Oil Processor and/or Re-refiner—If "Yes", mark all that apply.
☐	a. Processor
☐	b. Re-refiner
☐ Y ☑ N	3. Off-Specification Used Oil Burner
☐ Y ☑ N	4. Used Oil Fuel Marketer—If "Yes", mark all that apply.
☐	a. Marketer Who Directs Shipment of Off-Specification Used Oil to Off-Specification Used Oil Burner
☐	b. Marketer Who First Claims the Used Oil Meets the Specifications

D. Pharmaceutical Activities

☐ Y ☑ N	1. Operating under 40 CFR Part 266, Subpart P for the management of hazardous waste pharmaceuticals—if "Yes", mark only one. Note: See the item-by-item instructions for definitions of healthcare facility and reverse distributor.
☐	a. Healthcare Facility
☐	b. Reverse Distributor
☐ Y ☑ N	2. Withdrawing from operating under 40 CFR Part 266, Subpart P for the management of hazardous waste pharmaceuticals. Note: You may only withdraw if you are a healthcare facility that is a VSQG for all of your hazardous waste, including hazardous waste pharmaceuticals.

12. Eligible Academic Entities with Laboratories—Notification for opting into or withdrawing from managing laboratory hazardous wastes pursuant to 40 CFR Part 262, Subpart K.

☐ Y ☑ N	A. Opting into or currently operating under 40 CFR Part 262, Subpart K for the management of hazardous wastes in laboratories— If "Yes", mark all that apply. Note: See the item-by-item instructions for definitions of types of eligible academic entities.
☐	1. College or University
☐	2. Teaching Hospital that is owned by or has a formal written affiliation with a college or university
☐	3. Non-profit Institute that is owned by or has a formal written affiliation with a college or university
☐ Y ☑ N	B. Withdrawing from 40 CFR Part 262, Subpart K for the management of hazardous wastes in laboratories.

13. Episodic Generation

☐ Y ☑ N	Are you an SQG or VSQG generating hazardous waste from a planned or unplanned episodic event, lasting no more than 60 days, that moves you to a higher generator category. If "Yes", you must fill out the Addendum for Episodic Generator.

14. LQG Consolidation of VSQG Hazardous Waste

☐ Y ☑ N	Are you an LQG notifying of consolidating VSQG Hazardous Waste Under the Control of the Same Person pursuant to 40 CFR 262.17(f)? If "Yes", you must fill out the Addendum for LQG Consolidation of VSQG hazardous waste.

15. Notification of LQG Site Closure for a Central Accumulation Area (CAA) (optional) OR Entire Facility (required)

☐ Y ☑ N	LQG Site Closure of a Central Accumulation Area (CAA) or Entire Facility.
	A. ☐ Central Accumulation Area (CAA) or ☐ Entire Facility
	B. Expected closure date: _____ mm/dd/yyyy
	C. Requesting new closure date: _____ mm/dd/yyyy
	D. Date closed : _____ mm/dd/yyyy ☐ 1. In compliance with the closure performance standards 40 CFR 262.17(a)(8) ☐ 2. Not in compliance with the closure performance standards 40 CFR 262.17(a)(8)

16. Notification of Hazardous Secondary Material (HSM) Activity

☐ Y ☑ N	Are you notifying under 40 CFR 260.42 that you will begin managing, are managing, or will stop managing hazardous secondary material under 40 CFR 260.30, 40 CFR 261.4(a)(23), (24), (25), or (27)? If "Yes", you must fill out the Addendum to the Site Identification Form for Managing Hazardous Secondary Material.

17. Electronic Manifest Broker

☐ Y ☑ N	Are you notifying as a person, as defined in 40 CFR 260.10, electing to use the EPA electronic manifest system to obtain, complete, and transmit an electronic manifest under a contractual relationship with a hazardous waste generator?

18. Comments (include item number for each comment)

The facility has closed RCRA units managing wood treating waste and undergoing corrective action. Hazardous waste is generated occasionally during maintenance activities with the water treatment system and investigations or site maintenance.

19. Certification I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations. **Note: For the RCRA Hazardous Waste Part A permit Application, all owners and operators must sign (see 40 CFR 270.10(b) and 270.11)**.

CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Signature: Michael Slenska Date: 9/27/2024

Name: Michael Slenska
Title: President
Cavenham Forest Industries LLC

The Alabama Department of Environmental Management (ADEM) Administrative Code Part B permit application requirements are provided below. ADEM Administrative Code citations from 335-14-8-.02(5) and permit application section headings are presented in bold type. Cavenham Forest Industries LLC (CFI) responses are provided below each citation in standard type.

> **Part B of the permit application consists of the general information requirements of 335-14-8-.02(5), and the specific information requirements in 335-14-8-.02(5) through (19) applicable to the facility. The Part B information requirements presented in 335-14-8-.02(5) through (19) reflect the standards promulgated in 335-14-5. These information requirements are necessary in order for the Department to determine compliance with the 335-14-5 standards. If owners and operators of HWM facilities can demonstrate that the information prescribed in Part B cannot be provided to the extent required, the Department may make allowance for submission of such information on a case-by-case basis. Information required in Part B shall be submitted to the Department and signed in accordance with requirements in 335-14-8-.02(2). As discussed in 335-14-1-.01(1)(e), certain technical data, such as design drawings and specifications, engineering studies, geological interpretations, geological cross-sections, geological profiles, and survey plats involve the practice of engineering, land surveying, and/or geology and must be certified by a registered professional engineer, a professional land surveyor, and/or a licensed professional geologist, as applicable. For post-closure permits, only the information specified in Sec. 270.28 is required in Part B of the permit application.**

1.0 GENERAL FACILITY DESCRIPTION

335-14-8-.02(5)(b) General information requirements. The following information is required for all HWM facilities, except as 335-14-5-.01(1) provides otherwise:

1.1 A General Description of the Facility.

1.1.1 Plant History

Cavenham Forest Industries LLC (CFI) maintains a closed site in Mobile, Alabama that formerly produced treated wood products. The manufacturing process utilized creosote and pentachlorophenol under elevated temperature and pressure for preservative treatment of poles and piling. Plant operations commenced in 1938 and the plant operated until 1980, when the wood treating operation terminated and the manufacturing plant was dismantled. The previous owner, Crown Zellerbach Corporation, purchased the facility in 1972. CFI acquired the facility in May, 1986.

During the operating history, four (4) RCRA hazardous management waste units were utilized in the treatment process. These RCRA hazardous waste management units consisted of an Aeration Pond, two (2) Vacuum Ponds, Sand filtration Beds, and a Container Storage area. These units were closed between August 1987 and July 1990. An ADEM Certification of Closure was issued to the facility on April 8, 1991 and an initial Post-Closure Permit was issued to CFI by ADEM on February 5, 1991.

1.1.2 Facility Location

CFI's Mobile facility is positioned near north latitude 30º 43' 46" and west longitude 88º 03' 01" on the north side of the city of Mobile, Alabama. The facility's physical address is the south end of Herbert Street, which is just south of the Herbert Street intersection with Bay Bridge Road. Figure 1 is a map which indicates the location of the Mobile Facility. Figure 2 is a vicinity map showing the area around the facility. Figure 3 shows the existing topographic features of the site.

The site is situated in a principally flat, low-lying area, with site elevation ranging between 0 and 16 feet relative to the National Geodetic Vertical Datum (NGVD). The site is in an industrial area that is bounded on the north by the Star Paper Company warehouse area and on the west by Kimberly-Clark (formerly Scott Paper Company) solid waste landfill and warehouse. The east boundary of the site is an elevated railroad embankment. Immediately east of this embankment is the EOTT Energy petroleum bulk storage facility. The southern border of the property is formed by Three Mile Creek, an industrial waterway that flows into the Mobile River approximately l/4 mile from the plant's east boundary. South of Three Mile Creek on the opposite bank from the facility is a marine docks and railroad facility operated by the State of Alabama.

1.1.3 Closed Hazardous Waste Units

Prior to closure there were four (4) hazardous waste management units on the plant site. These units were:

- The Aeration Pond
- The Vacuum Ponds
- The Sand Filtration Beds, and
- The Container Storage area.

The locations of these units prior to closure are shown on Figure 4. A flow diagram for the wastewater process that existed when the facility was in operation is illustrated in Figure 5. A brief description of each unit is provided below.

1.1.4 Aeration Pond

The Aeration Pond was approximately 85 feet wide and 375 feet long with a K001 sludge layer approximately 1.5 feet thick. The pond was surrounded by an earthen dike that was approximately 7 feet high, being constructed of a clay core and a shell surface. The bottom of the pond was approximately at grade and was unlined. It is estimated that at the time of closure this facility contained approximately 1,770 yd^3 of K001 hazardous waste.

This Aeration Pond was part of a National Pollutant Discharge Elimination System (NPDES) treatment train that was utilized for the treatment and discharge of waste water from the wood preserving process and storm water run-off from the process areas.

The Aeration Pond was closed by dewatering the pond, solidifying the residual sludges, backfilling the pond area with clean soil, and constructing a RCRA cap over the area. A perimeter soil-bentonite slurry cutoff wall with a vertical high density polyethylene (HDPE) liner encloses approximately 80% of the former pond area (Figure 8). Closure occurred between August 1987 and July 1990. ADEM Certification of Closure was issued to the facility on April 8, 1991.

1.1.5 Vacuum Ponds

The Vacuum Ponds were composed of two (2) parallel ponds, each measuring approximately 30 feet wide by 225 feet long. The depth of the ponds was approximately 8 feet. The ponds were lined with a sprayed concrete material approximately 4 inches thick on the slopes and approximately 8 inches thick in the pond bottoms. The l5-foot wide area between the ponds was not lined. The two ponds were surrounded by a 4-foot high earthen ring levee composed of a clay core and shell surface.

The Vacuum Ponds were utilized as a source of contact cooling water for the wood preserving process. In such capacity the ponds were contaminated with K001 hazardous constituents and K001 sludge was generated in the bottom of the impoundments. At the time of closure the ponds were estimated to contain a total of approximately 3,270 yd^3 of K001 hazardous waste.

The Vacuum Ponds were closed by dewatering each of the ponds, solidifying the residual sludges, backfilling the ponds with soil, and building a RCRA cap over the area. A perimeter soil-bentonite slurry cutoff wall with a vertical high-density polyethylene (HDPE) liner surrounds these ponds (Figure 8). Closure occurred between August 1987 and July 1990. ADEM Certification of Closure was issued to the facility on April 8, 1991.

1.1.6 Sand Filtration (Drying) Beds

The Sand Filtration or drying beds were rectangular concrete boxes containing one (1) to two (2) feet of sand and a bottom layer of gravel. The boxes were open at the top, elevated above ground surface, and located on the west Vacuum Pond levee. The bottom(s) of the Sand Filtration boxes were above the elevation of the water in the Vacuum Ponds so that the filtered effluent could enter the ponds. Wastewater floc mixtures that required filtering entered the top of the Sand Filtration Beds and the clarified liquid exited through weep holes at their bottoms. The process was effective at retaining the floc sludge on the sand. The clarified liquid was allowed to drain, via pipe connections, into the vacuum ponds. The dried sludge was periodically transferred to drums for shipment to a secure offsite landfill. The drying beds were approximately 30'L x l5'W x 3'D in dimension (total) and contained less than 50 yd^3 of K001 waste at the time of closure.

The K001 contaminated sludges and materials that were in the Sand Filtration Beds were placed in the west Vacuum Pond and solidified during closure. The area is within the RCRA cap area which is surrounded by the perimeter HDPE lined cutoff wall. Closure occurred between August 1987 and July 1990. ADEM Certification of Closure was issued to the facility on April 8, 1991.

1.1.7 Container Storage

Approximately 700 square feet of the south end of the warehouse was used for container storage. The storage area was wood floored and was used as temporary storage for metal barrels (drums) containing dried sludge and miscellaneous contaminated materials (gloves, etc.) for ultimate off-site disposal. There were no containers in storage at the time of closure.

Additional details and specifications pertaining to closure of the above facilities are addressed in the *Mobile Facility Closure and Post-Closure Plan* and the reports from quality assurance monitoring of the closure by Soil Testing Engineers, Inc. Documentation of closure by Soil Testing Engineers, Inc. is included as Attachment A. Figures 6, 7, 8 and 10 are "As-Built" drawings of the closed facility. Figures 9, 11, 12, 13, 14 and 15 are construction design drawing for the closed facility.

2.0 CHEMICAL AND PHYSICAL ANALYSIS OF HAZARDOUS WASTE

335-14-8-.02(5)(b) 2. Chemical and physical analyses of the hazardous waste and hazardous debris to be handled at the facility. At a minimum, these analyses shall contain all the information which must be known to treat, store, or dispose of the wastes properly in accordance with Chapter 335-14-5.

2.1 Description of Hazardous Waste Generated

The hazardous waste that was formerly generated at the Mobile facility consisted of bottom sediment sludge from the treatment of waste water from a wood preserving process that used creosote or pentachlorophenol preservatives. This is listed hazardous waste K001 (ADEM Administrative Code Rule 335-14-2). The sludge was produced from the flocculation of wastewater with chemical flocculant and bentonite clay. The sludge (floc) was dewatered on Sand Filtration Beds and the dried sludge, which had a hard glassy pitch texture, was placed in drum containers and shipped to approved off-site facilities. The K001 sludge also accumulated in the bottom of the surface impoundments at the site.

The sludge that formed in the surface impoundments was basically an oil-water emulsion. At closure, these sludges were solidified such that their bearing capacity is capable of supporting the facility cover.

A flow diagram for the pre-closure wastewater treatment operation is presented as Figure 5. Wastewaters from the wood treating operation were initially treated in a "Blow down" vessel, API separators, and a condenser prior to entering a "Floc" tank. Wastewater was then flocculated and the clarified liquid pumped to the aeration tank. Treated water from the Aeration tank was periodically routed to the Aeration Pond, which aerated the wastewater prior to discharging it under NPDES permit. As a result of this process, the impoundment bottoms accumulated K001 sludge.

2.2 Analyses of Waste

The list of hazardous constituents which were the basis for listing K001 as hazardous is shown in Table 1. GC/MS analyses of the closed surface impoundment sludges are shown in Table 2.

2.3 Post-Closure Waste Generation

335-14-8-.02(5)(b) 3. A copy of the waste analysis plan required by 335-14-5-.02(4)(b) and, if applicable, 335-14-5-.02(4)(c).

During the post-closure period the only hazardous waste that will be generated from the closed units is from the recovery and treatment of contaminated groundwater. All water treatment activities will be conducted in a system permitted by NPDES. A copy of CFI's NPDES Permit for the Mobile Facility is included as Attachment B.

The treatment system may generate sludge, recovered creosote oil, or spent activated carbon as a result of normal operation. All exhausted activated carbon, and oily sludge wastewater treatment sludges will be conservatively manifested as K001 waste and disposed accordingly. A Waste Analysis Plan for CFI's Mobile site is included as Attachment C.

3.0 SECURITY PROCEDURES AND EQUIPMENT

335-14-8-.02(5)(b)(4) A description of the security procedures and equipment required by 335-14-5-.02(5), or a justification demonstrating the reasons for requesting a waiver of this requirement.

ADEM Adminstrative Code Rule: 335-14-8-.02(5)(b)(4) applies to active facilities. After facility closure there will be no active hazardous waste facilities remaining on the site. However, certain security equipment will be continued under 335-14-5-.078 in order to protect the integrity of the facility cap and equipment. Access by the public will not pose a hazard to human health, should access occur. However, public access will be prevented by maintenance of the site security system.

The following security equipment will be maintained during the post-closure period:

- The facility is fenced with a 6-foot high chain-link fence with a three (3) strand barbed-wire parapet (Figure 15).
- All gates, facilities and structures employed during the post-closure period are locked when CFI personnel or their representatives are not present.
- A lockable building for wastewater treatment system controls and small equipment storage.
- All facility fences and gates are posted with signs bearing the following legend:

CAUTION
UNAUTHORIZED PERSONNEL
KEEP OUT

These signs are posted so that they may be seen from any approach. Maximum distance between signs will be 50 feet. Signs are legible from a distance of 25 feet.

In addition, the sign at the facility fence gate will contain the following information:

- Name of Owner/Operator
- Address of Owner/Operator
- Telephone Number of Owner/Operator
- All monitor wells are equipped with locking covers to prevent tampering.
- A telephone is located in the office building.

4.0 POST-CLOSURE INSPECTION SCHEDULE

335-14-8-.02(5)(b)5 A copy of the general inspection schedule required by 335-14-5-.02(6)(b). Include where applicable, as part of the inspection schedule, specific requirements in 335-14-5-.09(5), 335-14-5-.10(4)(i), 335-14-5-.10(6), 335-14-5-.11(7), 335-14-5-.12(5), 335-14-5-.13(4), 335-14-5-.14(4), 335-14-5-.15(8), 335-14-5-.19(1) and .19(2), 335-14-5-.23(4), 335-14-5-.24(3), 335-14-5-.27(4), 335-14-5-.28(3), 335-14-5-.28(4), 335-14-5-.28(9), 335-14-5-.29(5), 335-14-5-.29(6), 335-14-5-.29(7), 335-14-5-.29(9), 335-14-5-.30(2), and 335-14-7-.08(3) [40 CFR 266.102(e)(8)].

The CFI facility is closed and the above referenced sections are not applicable to post-closure. An inspection schedule for the post-closure period, as specified in 335-14-5-.07(8)(1) is included in Attachment D and discussed below.

CFI has developed a written schedule for inspecting monitoring equipment, safety and emergency equipment, security devices and operating equipment (such as sump pumps) that are important to preventing, detecting, or responding to environmental or human health hazards in accordance with 335-14-5-.02-(6)(b). This schedule is kept at the Mobile facility and strictly followed.

A detailed inspection log listing each item to be inspected with notations concerning specific observations, actions and tests to be performed, is provided in Exhibit 1 of the Facility Inspection and Security Schedule, included as Attachment F. In addition, all personal protection equipment is inspected prior to each use. Any deterioration or malfunction of equipment or structures which the inspection reveals will be corrected, such that the problem does not lead to an environmental

or human health hazard. The facility inspection log, (Exhibit F-1 of Attachment F), provides space to indicate the recommended remedial action, the action taken, and the date the action was completed. In the event a hazard is imminent or has already occurred, CFI will respond as soon as possible to rectify the situation.

5.0 PREPAREDNESS AND PREVENTION

335-14-8-.02(5)(b)6. A justification of any request for a waiver(s) of the preparedness and prevention requirements of Rule 335-14-5-.03.

The CFI facility is closed.

335-14-8-.02(5)(b)7. A copy of the contingency plan required by Rule 335-14-5-.04. Note: Include, where applicable, as part of the contingency plan, specific requirements in 335-14-5-.11(8) and 335-14-5-.12(6).

335-14-8-.02(5)(b)8. A description of procedures, structures, or equipment used at the facility to:

- **(i) Prevent hazards in unloading operations (for example, ramps, special forklifts);**
- **(ii) Prevent run-off from hazardous waste handling areas to other areas of the facility or environment, or to prevent flooding (for example, berms, dikes, trenches);**
- **(iii) Prevent contamination of water supplies;**
- **(iv) Mitigate effects of equipment failure and power outages;**
- **(v) Prevent undue exposure of personnel to hazardous waste (for example, protective clothing); and**
- **(vi) Prevent releases to atmosphere.**

The CFI facility is closed and only waste associated with the on-site RCRA remediation will be handled during the post-closure period. Secondary containment is used for piping and water treatment areas where groundwater treatment occurs. Personnel are trained to protect themselves from exposure to contaminated groundwater. The contaminants occur at low concentrations and have relatively low vapor pressures, therefore, significant atmospheric releases do not occur.

335-14-8-.02(5)(b)9. A description of precautions to prevent accidental ignition or reaction of ignitable, reactive or incompatible wastes as required to demonstrate compliance with 335-14-5-.02(8), including documentation demonstrating compliance with 335-14-5-.02(8)(c).

All CFI remediation waste streams are expected to have flash points that retard ignition. The waste streams are not reactive.

335-14-8-.02(5)(b)10. Traffic pattern, estimated volume (number, types of vehicles) and control (for example, show turns across traffic lanes, and stacking lanes (if appropriate); describe access road surfacing and load bearing capacity; show traffic control signals).

Typically, only one vehicle is used on the site and traffic control is not an issue. Although no hazardous or dangerous incidents are expected to result from post-closure activities at the site, a Contingency Plan is provided for the site as Attachment E. The plan addresses post-closure operations.

6.0 FACILITY LOCATION INFORMATION

335-14-8-.02(5)(b)11. Facility location information:

(i) The owner or operator of a new facility must identify the political jurisdiction (e.g., county, township, or election district) in which the facility is proposed to be located.

(ii) [Reserved]

(iii) Owners and operators of all facilities shall provide an identification of whether the facility is located within a 100-year floodplain. This identification must indicate the source of data for such determination and include a copy of the relevant Federal Insurance Administration (FIA) flood map, if used, or the calculations and maps used where an FIA map is not available. Information shall also be provided identifying the 100-year flood level and any other special flooding factors (e.g., wave action) which must be considered in designing, constructing, operating, or maintaining the facility to withstand washout from a 100-year flood.

The entire CFI Mobile facility is located within the 100 year floodplain as shown on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map for Mobile County and Incorporated Areas (Map Number 01097C0556; July 6, 1998). The property is zoned AE and the 100-year flood elevation is 12 feet (National Geodetic Vertical Datum of 1929).

(iv) Owners and operators of facilities located in the 100-year floodplain must provide the following information:

(I) Engineering analysis to indicate the various hydrodynamic and hydrostatic forces expected to result at the site as consequence of a 100-year flood.

Attachment D is an engineering analyses that was prepared prior to closing the hazardous waste units. For additional information the reader is referred to the Closure Plan and the information provided in the response to 335-14-8-.02(5)(b)11.(iv)(II) below.

(II) Structural or other engineering studies showing the design of operational units (e.g., tanks, incinerators) and flood protection devices (e.g., floodwalls, dikes) at the facility and how these will prevent washout.

During the post-closure period the closed hazardous waste units that comprise the landfill will be protected from wave and erosion damage by the perimeter breakwater levee and road which partially encircles the closed cell. The breakwater levee has been designed to minimize the wave effects caused by a 100 mile per hour hurricane wind. Additional existing obstructions to the southeast of the closed facility will restrict the development of waves generated by a typical southeasterly hurricane wind. These obstructions include a train embankment, a train crossing (over Three Mile Creek), and a six to eight foot fill west of the CFI property boundary.

The design of the closed cell, with surrounding breakwater levee, utilizes the breakwater levee to protect the cell from washout in the event of flooding. A slope failure of the breakwater levee will not constitute a washout, as there will be no resulting movement of contaminants from the closed cell. In effect, the breakwater levee acts as a sacrificial structure to protect the cell from wave or storm damage.

If flood water levels in Three Mile Creek cause overtopping of the breakwater levee, damage to the closed cell will be limited to superficial erosion of the grass-covered topsoil layer. The vegetation root system will provide erosion protection from stormwater inundations over the completed landfill. Temporary flood waters will have no effect on the integrity of the underlying synthetic liner.
Receding floodwater is allowed to freely drain from the cell area westward through the open side of the horseshoe shaped perimeter breakwater levee road. Drainage through the open side is sufficient to eliminate large head differences on opposing sides of the breakwater levee, thus eliminating the risk of levee failure due to hydrostatic pressure.

Embankments on the exterior of the breakwater levee are designed to include a geotextile mat overlain by a stone rip-rap which provides added resistance to slope shear failure. The flexible nature of the geotextile accommodates calculated settlements of the site subsoils.

The factor of safety in sliding of the closed cell cap is greater than 1.0, due to several factors. First, the breakwater levee acts as a berm providing weight to counteract sliding below the base of the fill. Second, the cohesive strength of the levee is much greater than the surrounding soils and reduces the possibility of a failure extending through the levee. Third, the fill cap and breakwater road embankment were constructed gradually in specified lifts so that induced pore water pressures in the compressible subsoils were allowed to dissipate to safe levels during

construction. Construction in this manner results in an increase in the strength of the subsoil and a corresponding increase in fill and embankment stability. Engineering calculations are provided in the Closure Plan.

By providing the protections described above, the facility will remain in compliance with the requirements of ADEM Administrative Code Rule 335-14-5-.02(9) throughout the post-closure period. Compliance will be maintained by preventing washout of any hazardous waste by a 100-year flood or hurricane. It has been shown that a rise in flood waters to the 100-year flood elevation (12-feet NGVD) will not cause a washout of hazardous waste.

Provisions to prevent normal run-on to the cell during post-closure include the inspection and maintenance of the site breakwater levee which borders the closed cell to the north, east, and south. Run-on from the west is intercepted by an interception ditch which carries drainage southward. The closed cell's west face and rainfall collection ditches slope and drain westward, and in conjunction with the interception ditch prevent run-on from the west.

Run-off control of the post-closure facility will include maintenance of slopes of 5 percent on the final cap which have been designed to promote drainage and prevent ponding on the flexible membrane liner. Maintenance of the grassy vegetation cover will assure that erosion caused by rainfall will be minimized and will not affect the integrity of the cell cap.

(III) If applicable, and in lieu of 335-14-8-.02(5)(b)11.(iv)(I) and (b)11.(iv)(II), a detailed description of procedures to be followed to remove hazardous waste to safety before the facility is flooded, including:

I. Timing of such movement relative to flood levels, including estimated time to move the waste, to show that such movement can be completed before floodwaters reach the facility.
II. A description of the location(s) to which the waste will be moved and demonstration that those facilities will be eligible to receive hazardous waste in accordance with the regulations under Chapters 335-14-5 through 335-14-8.
III. The planned procedures, equipment, and personnel to be used and the means to ensure that such resources will be available in time for use.
IV. The potential for accidental discharges of the waste during movement.

(v) Existing facilities NOT in compliance with 335-14-5-.02(9)(a) shall provide a plan showing how the facility will be brought into compliance and a schedule for compliance.

The CFI facility is closed and movement of waste during an emergency is not applicable**.**

7.0 PERSONNEL TRAINING PROGRAM DOCUMENTATION

335-14-8-.02(5)(b)12. An outline of both the introductory and continuing training programs by owners or operators to prepare persons to operate or maintain the HWM facility in a safe manner as required to demonstrate compliance with 335-14-5-.02(7). A brief description of how training will be designed to meet actual job tasks in accordance with requirements in 335-14-5-.02(7)(a)3.

CFI's personnel training programs are designed to instruct employees in the proper precautions and handling procedures for K001 hazardous waste constituents; and, implementation of the appropriate emergency response procedures in the event of a spill, fire, or other hazard. The goal of the program is to insure the protection of human health and the environment through proper management of hazardous waste and waste streams, chemicals or other substances that contain hazardous constituents.

The CFI personnel training program employed during the post-closure period is included as Attachment G. This plan was designed to meet the regulatory requirements of ADEM Administrative Code Rule 335-14-8-.02(5)(b)12.

8.0 CLOSURE AND POST-CLOSURE PLAN AND DOCUMENTATION

335-14-8-.02(5)(b)13 A copy of the closure plan and, where applicable, the post-closure plan required by 335-14-5-.07(3), 335-14-5-.07(9), and 335-14-5-.10(8). Include, where applicable, as part of the plans, specific requirements in 335-14-5-.09(9), 335-14-5-.10(8), 335-14-5-.11(9), 335-14-5-.12(9), 335-14-5-.13(11), 335-14-5-.14(11), 335-14-5-.15(12), 335-14-5-.19(1) and (2), 335-14-5-.23(5), 335-14-5-.24(2), 335-14-5-.24(4), 335-14-5-.30(3), and 335-14-7-.08(3) [40 CFR 266.102(e)(11)].

The Mobile site has been closed and certified closed in accordance with the applicable regulatory requirements of 335-14-5-.11(9) and 335-14-8-.02(5)(b)13.

The post-closure plan for the CFI site is contained herein and is the combination of all pertinent material contained within this document. The CFI Mobile facility closure activities are summarized in Section 1 of this document. Some of the pertinent attachments to the Part B are described below:

> Attachment C is a Waste Analysis Plan that describes the expected waste streams that will occur during the post-closure period, and provides sampling and analytical techniques that will be utilized to properly characterize the waste.
>
> Attachment E is a Contingency Plan which provides contact information and emergency response procedures for the site. CFI does not expect to implement the plan, however, it

is available should an emergency occur and be needed during the post-closure care period.

Attachment F is the Inspection and Security Schedule which provides information regarding inspection of the hazardous waste management area cap, monitoring wells, treatment systems, etc. The frequency for conducting the inspections is provided and a written log is included.

Attachment G describes the Personnel Training Program which was designed to instruct employees in the proper precautions and handling procedures for the K001 hazardous waste that is managed at the site, and implementation of the proper emergency response procedures in the event of a spill, fire, or other hazard. The goal of the program is to insure the protection of human health and the environment through proper management of hazardous waste.

Attachment P is the Groundwater Monitoring Plan for the facility. The plan describes the monitoring program and provides locations of wells to sample, sampling parameters, sampling frequency, sampling procedures and analytical techniques.

Attachment R describes the Corrective Action Plan for the facility. The plan describes recovery, injection and air sparging wells that are used to hydraulically contain and remediate the groundwater at this site.

8.1 Corrective Action Management Units

In April, 1995, CFI submitted a *Soil Corrective Action Work Plan* which proposed construction of two (2) Corrective Action Management Units (CAMUs) at the Mobile facility. The designated CAMUs consisted of the North CAMU and the Central CAMU areas. The CAMUs were constructed in general accordance with the plan and ADEM approved the CAMU Construction Certification report in correspondence dated May 6, 1998. These units have served as staging areas and treatment areas for on-site soils that contained hazardous constituent concentrations from past operations. On-site soils were excavated and placed within the CAMUs for treatment using biological techniques. Following treatment to hazardous constituent concentrations that were below risk-based action levels established for the site, the soil was used on-site as general fill.

The locations of the CAMUs are shown on Figure 3. The North CAMU was designed to serve as the primary soil treatment area, while the Central CAMU acted as a soil screening area. Attachment H provides a description of the CAMUs, locations on site that were excavated and copies of chemical analyses for the soil remediation project. Attachment H also certifies the closure of the CAMUs.

9.0 DOCUMENTATION OF NOTICE TO DEED

335-14-8-.02(5)(b)14. For hazardous waste disposal units that have been closed, documentation that notices required under 335-14-5-.07 (10) have been filed.

The hazardous waste management units at the CFI Mobile site are closed. Documentation of this certification, as provided within the final certification report by Soil Testing Engineers, Inc., is included as Attachment A of this document. The required survey plats and notices have been recorded in the deed and filed with the County of Mobile. A copy of the deed documents are provided as Attachment I.

10.0 CLOSURE COST ESTIMATE

335-14-8-.02(5)(b)15 The most recent closure cost estimate for the facility prepared in accordance with 335-14-5-.08(3) and a copy of the documentation required to demonstrate financial assurance under 335-14-5-.08(4). For a new facility, a copy of the required documentation may be submitted 60 days prior to the initial receipt of hazardous wastes, if that is later than the submission of the Part B.

The Mobile facility has completed its closure and an estimate is no longer pertinent. Documentation supporting this closure is provided in Attachment A.

11.0 POST-CLOSURE COST ESTIMATE AND FINANCIAL ASSURANCE

335-14-8-.02(5)(b)16 Where applicable, the most recent post-closure cost estimate for the facility prepared in accordance with 335-14-5-.08(5) plus a copy of the documentation required to demonstrate financial assurance under 335-14-5-.08(6). For a new facility, a copy of the required documentation may be submitted 60 days prior to the initial receipt of hazardous wastes, if that is later than the submission of the Part B.

The most recent post-closure cost estimate is included in Attachment J. The most recent post-closure financial assurance documentation is provided in Attachment K. CFI has revised the post-closure cost estimate to reflect the revised groundwater monitoring requirements following the re-issuance of the Permit.

335-14-8-.02(5)(b)17 Where applicable, a copy of the insurance policy or other documentation which comprises compliance with the requirements of 335-14-5-.08(8). For a new facility, documentation showing the amount of insurance meeting the specification of 335-14-5-.08(8)(a) and, if applicable, 335-14-5-.08(8)(b), that the owner or operator plans to have in effect before initial receipt of hazardous waste for treatment, storage, or disposal.

A request for a variance in the amount of required coverage, for a new or existing facility, may be submitted as specified in 335-14-5-.08(8)(c).

All units are closed as this facility.

12.0 TOPOGRAPHIC MAP

335-14-8-.02(5)(b)19. A topographic map showing a distance of 1000 feet around the facility at a scale of 2.5 centimeters (1 inch) equal to not more than 61.0 meters (200 feet). Contours must be shown on the map. The contour interval must be sufficient to clearly show the pattern of surface water flow in the vicinity of and from each operational unit of the facility. For example, contours with an interval of 1.5 meters (5 feet), if relief is greater than 6.1 meters (20 feet), or an interval of 0.6 meters (2 feet), if relief is less than 6.1 meters (20 feet). Owners and operators of HWM facilities located in mountainous areas should use large contour intervals to adequately show topographic profiles of facilities. The map shall clearly show the following:

- **(i) Map scale and date;**
- **(ii) 100-year floodplain area;**
- **(iii) Surface waters including intermittent streams;**
- **(iv) Surrounding land uses (residential, commercial, agricultural, recreational);**
- **(v) A wind rose (i.e., prevailing wind speed and direction);**
- **(vi) Orientation of the map (north arrow);**
- **(vii) Legal boundaries of the HWM facility site;**
- **(viii) Access control (fences, gates);**
- **(ix) injection and withdrawal wells both on-site and off-site;**
- **(x) Buildings; treatment, storage or disposal operations; or other structure (recreation areas, run-off control systems, access and internal roads, storm, sanitary, and process sewerage systems, loading and unloading areas, fire control facilities, etc.);**
- **(xi) Barriers for drainage or flood control; and**
- **(xii) Location of operational units within the HWM facility site, where hazardous waste is (or will be) treated, stored, or disposed (include equipment cleanup areas).**
- **(xiii) Location of all SWMUs and AOCs.**

A site plan and topographic contour map for the facility are presented as Figure 17. Additional topographic information is provided on other maps included in this document. All maps have a scale, date, north arrow and information to meet regulatory requirements. The following information can be found in the figure listed next to it.

Surface Water	Figure 1
Surrounding Land Use (USGS Topographic)	Figure 1 and Figure 2

100 Year Floodplain	Figure 30
Wind Rose	Figure 16
Legal Boundary	Figure 17
Access Control	Figure 3
Well Locations	Figures 3 and Figure 24
Buildings & Structures	Figure 3
Barriers for Drainage Control	Figures 6 & 17
Location of Former Operational Units	Figure 4
Location of Corrective Action Management Unit	Figure 3
Facility Contour Map	Figure 17
Point of Compliance Well Locations	Figure 31
Solid Waste Management Unit Locations	Figure 32

13.0 OTHER INFORMATION

335-14-8-.02(5)(b)20. Applicants may be required to submit such information as may be necessary to enable the Department to carry out its duties under other laws as required in 335-14-8-.01(3).

Acknowledged.

335-14-8-.02(5)(b)21. For land disposal facilities; if a case-by-case extension has been approved under 335-14-9-.01(5) or a petition has been approved under 335-14-9-.01(6), a copy of the notice of approval for the extension or petition is required.

Acknowledged. The CFI facility is closed.

335-14-8-.02(5)(b)22. A summary of the pre-application meeting, along with a list of attendees and their addresses, and copies of any written comments or materials submitted at the meeting, as required under Rule 335-14-8-.08(5)(a)3.

Acknowledged. The CFI facility is closed.

14.0 GROUNDWATER PROTECTION

335-14-8-.02(5)(c) Additional information requirements. The following additional information regarding protection of groundwater is required from owners or operators of hazardous waste facilities containing a regulated unit except as provided in 335-14-5-.06(1)(b):

14.1 Groundwater Monitoring Data Summary

335-14-8-.02(5)(c) 1. A summary of the groundwater monitoring data obtained during the interim status period under 335-14-6-.06(1) through (5) where applicable, or the previous period if the application is for permit renewal;

The owners of the facility elected to close the units and not operate under interim status regulations; however, a summary of site monitoring data collected during the post-closure period is included as Attachment L. Copies of laboratory analytical reports from January 1, 2009 to December 31, 2011 are provided in Attachment M. Copies of Appendix IX laboratory reports are provided in Attachment N.

14.2 Identification of the Uppermost Aquifer

335-14-8-.02(5)(c)2 Identification of the uppermost aquifer and aquifers hydraulically interconnected beneath the facility property, including groundwater flow direction and rate, and the basis for such identification (i.e., the information obtained from hydrogeologic investigations of the facility area);

Extensive soil boring data has been accumulated for the Mobile site. Figure 18 indicates the locations of the existing geotechnical borings and monitoring wells. Soil boring logs for the Mobile site are included in Attachment O. Figure 19 is a subsurface soil profile that illustrates the types and relative thickness of subsurface soils. Site borings were conducted as part of CFI's *Ground Water Quality Assessment*, *Lower Aquifer Ground Water Quality Assessment*, and the *Mobile Facility Closure and Post Closure Plan*. Additional information can be obtained from these reports. The borings indicate that the site is directly underlain by five (5) distinct soil horizons that can be readily identified throughout much of the site area. From the surface downward they include:

(i) A layer of black organic and/or silty clay that is present throughout much of the site. The layer is approximately 10 feet in average thickness in the vicinity of the former production areas.

(ii) An "Upper Sand" layer composed of light gray to buff silty to fine sand. The thickness of this sand varies widely across the site (Figure 20), appearing to increase to the east and south near Three Mile Creek, and pinching out along the western site border.

(iii) A "Confining Clay" aquitard that is composed of a wide range of soils, ranging from peat and peaty (organic) very soft to stiff plastic clay, varying in color from black to brown and gray mixtures, to, gray, very soft to stiff, plastic, silty, sandy clay. Figure 21 is an isopach of the Confining Clay.

(iv) The "Lower Sand" is composed of a massive sand formation that ranges in composition from silty sands to coarse sand and pea gravel. This sand is laterally continuous beneath the site with a total thickness that ranges from approximately 60 to 110 feet.

(v) A very stiff blue green "Marine Clay" that is laterally continuous beneath the site and reported to have a thickness exceeding 200 feet.

Two distinct hydrogeologic units have been identified within this stratigraphic sequence and are referred to as the "Upper Aquifer" and the "Lower Aquifer". The Upper Aquifer is the uppermost permeable zone beneath the site and consists of the water-saturated sands of the Upper Sand horizon. The Upper Aquifer is separated from the Lower Aquifer by the Confining Clay aquitard. The Lower Aquifer consists of the water-bearing sands of the Lower Sand horizon. The hydraulic characteristics of each of these are summarized below.

Upper Aquifer

The Upper Aquifer is composed of a uniform layer of light gray to buff water-bearing silty sand. These sands appear to increase in thickness to the south and east, and thin to the west. In the vicinity of the hazardous waste management area silts and sands appear to transition laterally to peat and organic clay strata in the west. To the south, the Upper Aquifer is in hydraulic communication with Three Mile Creek. Figure 20 is an isopach of the Upper Sand.

Throughout the southern half of the site the Upper Aquifer is separated from the Lower Aquifer by a “Confining Clay” (aquitard). In the northern portion of the site the aquitard is missing and the Upper and Lower Aquifer are not distinct stratigraphic units in this area, i.e., they form a single water-bearing unit.

The horizontal groundwater flow in the Upper Aquifer is generally to the south-southeast, towards Three Mile Creek, but has been modified locally by the installation of the HDPE-lined cutoff wall and corrective action recovery wells (Figure 22). The average hydraulic gradient for the Upper Aquifer is 0.0009 ft/ft, based on the November 2011 water levels in wells RW-7 and B-128.

The average linear horizontal groundwater velocity (v) in the Upper Aquifer can be calculated using the modified Darcy Equation (Freeze and Cherry, 1979).

$$v = ki/n$$

where v = velocity (cm/s)
i = hydraulic gradient (ft/ft)
n = soil porosity

Using this equation an average linear groundwater flow rate of 0.030 ft/day was calculated using the average hydraulic gradient of 0.0009 ft/ft, assuming an effective porosity of 0.20, and using the average hydraulic conductivity of the Upper Aquifer (6.6 ft/day - Corrective Action Plan of July 14, 1992). Groundwater flow rates are considerably higher in the vicinity of the recovery wells.

Lower Aquifer

The Lower Aquifer is generally encountered in borings that extend beyond 20 to 30 feet below land surface. It is composed of a relatively massive water-bearing sand with thickness that ranges from 60 to 110 feet. This unit has been found in all of the deeper borings and appears to continuously underlie the site.

Figure 23 is a potentiometric map of the Lower Aquifer based on water level measurements obtained in November 2011. Groundwater flow is generally to the southeast, toward the groundwater recovery wells RW-8A, RW-8B, RW-9 and RW-10. The average hydraulic gradient was calculated to be 0.002 ft/ft, based on water level data from wells UG-2, B-27, B-59A and B-25. An average linear groundwater flow rate of 0.96 ft/day was calculated using the average hydraulic gradient (0.001 ft/ft), assuming an effective porosity of 0.25, and using the average hydraulic conductivity of the Lower Aquifer (120 ft/day - Corrective Action Plan of July 14, 1992). Groundwater flow rates are accelerated in the vicinity of the recovery wells.

14.3 "Point of Compliance" Well Locations

335-14-8-.02(5)(c)3 On the topographic map required under 335-14-8-.02(5)b)19., a delineation of the waste management area, the property boundary, the proposed "point of compliance" as defined under 335-14-5-.06(6), the proposed location of groundwater monitoring wells as required under 335-14-5-.06(8), and, to the extent possible, the information required in 335-14-8-.02(5)(c)2.;

The waste management area, property boundary and the "point of compliance" well locations are indicated on Figure 31. The proposed locations of the groundwater monitor wells are provided in the Groundwater Monitoring Plan, Attachment P.

14.4 Description of Any Contamination Plume

335-14-8-.02(5)(c 4. A description of any plume of contamination that has entered the groundwater from a regulated unit at the time that the application was submitted that: (i) Delineates the extent of the plume on the topographic map required under 335-14-8-.02(5)(b)19.; (ii) Identifies the concentration of each Chapter 335-14-5-Appendix IX

constituent throughout the plume or identifies the maximum concentrations of each Chapter 335-14-5-Appendix IX constituent in the plume;

Past operations at this site have resulted in an impact to the shallow groundwater by wood treating constituents. Appendix IX and subsequent post-closure analyses of the groundwater for metals, volatile organics, base neutral and acid extractable compounds have produced a sizeable database of analytical data that characterize the impact.

During the operating life of the facility, two types of wood treatment occurred, treatment with a pentachlorophenol-based preservative and treatment with a creosote-based preservative. Creosote was used for a much longer time period than pentachlorophenol, and the organic compounds observed in the groundwater underlying the site are those predominantly found in creosote.

Attachment L presents a historical analytical summary for samples collected from site monitoring wells during the time period January 1, 2001 through December 31, 2011 (last semiannual sampling). Tables L-1 and L-2 provides a summary of analytical results for the last 3 years.

Figure 24 provides the most recent (September, 2011) total volatile organic isoconcentration contours for the Upper Aquifer. An analysis of the data indicates that the total volatile organic contaminant concentration typically makes up less than 1 percent of the observed groundwater organics. As indicated in the figure and in Attachment L-1, the highest concentrations of volatile organics were observed in wells RC-3 and RW-6, on the south side of the Hazardous Waste Management Area and well E-1 on the north side.

Figure 25 provides the most recent (September, 2011) total phenolic isoconcentration contours for the Upper Aquifer. An analysis of the data indicates that the total phenol contaminant concentration typically makes up less than 4 percent of the observed groundwater organics where it is present. As indicated in the figure and in Attachment L-1, the highest concentrations of phenols were observed in wells RC-1 and RW-6, on the east side of the Hazardous Waste Management Area.

Figure 26 provides the most recent (September, 2011) total base/neutral constituent isoconcentration contours for the Upper Aquifer. An analysis of the data indicates base/neutral constituents typically makes up greater than 95 percent of the observed groundwater organics. As indicated in the figure and in Attachment L-1, the highest concentrations of base/neutral constituents were observed in wells RC-1, RW-6, T-2, RC-3 and E-1, in the vicinity of the Hazardous Waste Management Area.

Figure 27 provides the most recent (September, 2011) total volatile organic isoconcentration contours for the Lower Aquifer. The total volatile organic concentration ranges up to 20 percent

of total organics (RC-1A). As indicated in the figure and in Attachment L-1, the highest concentrations of volatile organics were observed in wells RW-2, RW-3a, RW-4 and RW-5 and RC-1A, which are screened beneath the Hazardous Waste Management Area. Comparing these values with those of the Upper Aquifer (Figure 24) indicate that the volatile concentrations in the Upper Aquifer to be similar.

Figure 28 provides the most recent (September, 2011) total phenolic isoconcentration contours for the Lower Aquifer. The total phenol contaminant concentration typically makes up less than 2 percent of the observed groundwater organics. As indicated in the figure and in Attachment L-1, the highest concentrations of Lower Aquifer phenols were observed in wells RW-3, RW-4 and RW-5, which are screened beneath the Hazardous Waste Management Area, respectively. Comparing the highest total concentrations observed in Figure 28 with those of Figure 25 reveals similar concentrations in the Upper and Lower Aquifer.

Figure 29 provides the most recent (September, 2011) total base/neutral constituent isoconcentration contours for the Lower Aquifer. The base/neutral constituents make up 80 percent or more of the observed groundwater organics in the Lower Aquifer. As indicated in the figure and in Attachment L-1, the highest concentrations of base/neutral constituents were observed in wells RW-3A, RW-4, RW-5, RC-1A and RC-2A, which are screened beneath the Hazardous Waste Management Area. Comparing the highest total concentrations observed in Figure 29 with those of Figure 26 reveals generally lower concentrations in the Upper Aquifer than in the Lower Aquifer.

14.4.1 Extent of Contaminant Plume

The extent of the groundwater contaminant plume as of September, 2011 is indicated on the scaled drawings provided as Figures 24 through 29. The analytical results for these figures are summarized in Attachment L and copies of the laboratory analytical reports with chain-of-custody documentation are provided in Attachment M.

Prior to implementation of groundwater corrective action at this facility, the contaminant plume extended to the facility property boundary along the southeastern side of the facility. At that time (1992), low levels of volatile organics and base/neutral constituents were observed in the downgradient wells DG-1A, B-102. As a result of the corrective action, the contaminant levels in these wells have decreased to concentrations that are below the method detection limit.

14.4.2 Characteristics of Contaminant Plume

A discussion of the contaminants that compose the groundwater plume is provided in Section 14.4, above. The results for all Appendix IX sampling events are provided in Attachment N. Attachment L is a summary of the historical data for each Appendix IX constituent that has been detected at this facility for the time period January 1, 2002 through December 31, 2011.

The historical data (Attachment L) indicate the contaminant plume is composed of polycyclic aromatic hydrocarbons (PAHs), phenols, volatile organic compounds and metals. Of these base/neutral constituents typically makes up greater than 95 percent of the contaminants in the Upper Aquifer and 80 percent or more in the Lower Aquifer concentration present. A listing of groundwater constituent concentrations in each monitoring well is provided in Attachment L. The parameter list includes all Appendix IX parameters detected at this site. Copies of the Appendix IX laboratory reports are provided in Attachment N.

Tables L-1 and L-2 (Attachment L) provide descriptive statistics for the data collected during the last three years. The tables show the number of times each constituent was detected at a concentration that exceed the method detection limit and also the number of times the concentration exceeded health risk-based criteria. Table L-4 provides organic constituent statistics for each well location that is routinely sampled.

15.0 GROUNDWATER MONITORING

335-14-8-.02(5)(c)5 Detailed plans and an engineering report describing the proposed groundwater monitoring program to be implemented to meet the requirements of 335-14-5-.06(8);

Past industrial activities at the CFI site have resulted in an impact to both the Upper and Lower Aquifers. CFI has implemented a corrective action program to remediate the groundwater in the vicinity of the closed units that is impacted by the constituents of concern. The required Groundwater Monitoring Plan for the site is included as Attachment P.

15.1 Detection Monitoring Program

335-14-8-.02(5)(c)6 If the presence of hazardous constituents has not been detected in the groundwater at the time of permit application, the owner or operator must submit sufficient information, supporting data and analyses to establish a detection monitoring program which meets the requirements of 335-14-5-.06(9). This submission must address the following items specified under 335-14-5-.06(9):

(i) A proposed list of indicator parameters, waste constituents, or reaction products that can provide a reliable indication of the presence of hazardous constituents in the groundwater;
(ii) A proposed groundwater monitoring system;
(iii) Background values for each proposed monitoring parameter or constituent, or procedures to calculate such values; and
(iv) A description of proposed sampling, analysis and statistical comparison procedures to be utilized in evaluating groundwater monitoring data;

A detection monitoring program is not presently applicable at this facility due to the impact of the closed units on the shallow groundwater.

15.2 Compliance Monitoring Program

335-14-8-.02(5)(c)7 If the presence of hazardous constituents has been detected in the groundwater at the point of compliance at the time of permit application, the owner or operator must submit sufficient information, supporting data, and analyses to establish a compliance monitoring program which meets the requirements of 335-14-5-.06(10). Except as provided in 335-14-5-.06(9)(g)5., the owner or operator must also submit an engineering feasibility plan for a corrective action program necessary to meet the requirements of 335-14-5-.06(11), unless the owner or operator obtains written authorization in advance from the Department to submit a proposed permit schedule for submittal of such a plan. To demonstrate compliance with 335-14-5-.06(10), the owner or operator must address the following items:

(i) A description of the wastes previously handled at the facility;
(ii) A characterization of the contaminated groundwater, including concentrations of hazardous constituents;
(iii) A list of hazardous constituents for which compliance monitoring will be undertaken in accordance with 335-14-5-.06(8) and (10);
(iv) Proposed concentration limits for each hazardous constituent, based on the criteria set forth in 335-14-5-.06(5)(a), including a justification for establishing any alternate concentration limits;
(v) Detailed plans and an engineering report describing the proposed groundwater monitoring system, in accordance with the requirements of 335-14-5-.06(8); and
(vi) A description of proposed sampling, analysis and statistical comparison procedures to be utilized in evaluating groundwater monitoring data; and

The facility is conducting corrective action and is proposing a groundwater monitoring program to monitor the corrective action as described below.

16.0 CORRECTIVE ACTION PROGRAM

335-14-8-.02(5)(c)8. If hazardous constituents have been measured in the groundwater which exceed the concentration limits established under 335-7-2-.03(1), 335-7-2-.04(1), or Table 1 of 335-14-5-.06(5), or if groundwater monitoring conducted at the time of permit application under 335-14-6-.06(1) through (5) at the waste boundary indicates the presence of hazardous constituents from the facility in groundwater over background concentrations, the owner or operator must submit sufficient information, supporting data, and analyses to establish a corrective action program which meets the requirements of 335-14-5-.06(11). However, an owner or operator is not required to submit information to establish a corrective action program if he demonstrates to the Department that alternate concentration limits will protect human health and the environment after considering the criteria listed in 335-14-5-.06(5)(b). An owner or operator who is not required to establish a corrective action program for this reason must instead submit sufficient information to establish a compliance monitoring program which meets the requirements of 335-14-5-.06(10) and 335-14-8-.02(5)(c)6. To demonstrate compliance with 335-14-5-.06(11), the owner or operator must address, at a minimum, the following items:

16.1 Groundwater Characterization

335-14-8-.02(5)(c)8(i) A characterization of the contaminated groundwater, including concentrations of hazardous constituents;

The hazardous waste previously managed at this facility as part of the wood treating process was the listed waste hazardous waste K001 (bottom sediment sludge from the treatment of wastewaters from wood preserving processes that use creosote and/or pentachlorophenol preservatives). The K001 waste was managed in the Aeration Pond, the two Vacuum Ponds and other units described in Section 1.1. Releases from these units and other site operations associated with the treatment process resulted in a impact to the shallow groundwater at the facility, predominantly by the constituents that are known to be associated with this waste stream. The constituents that are commonly found in K001 waste are listed in Table 1.

The groundwater at this facility has been analyzed for Appendix IX constituents to fully characterize the contaminants that were released during past operations. Copies of Appendix IX laboratory reports are provided in Attachment N. Please refer to Section 14.4 of this document for additional information pertaining to the characteristics of the groundwater plume.

Additionally, Attachment L provides a summary of the analytical results for each monitoring well, as described below.

CFI has analyzed the list of Appendix IX constituents originally identified in the groundwater since January 1991 in accordance with the existing Post-Closure Permit. Attachment L is a statistical summary of that data for the last three years. Table L-1 (Attachment L) provides descriptive statistics for the organic constituents collected during the last three years. Table L-2 provides similar statistics for the inorganic constituents. Table L-3 compares the most recent results for each well to health-based values.

16.2 Groundwater Concentration Limits

335-14-8-.02(5)(c)8(ii) The concentration limit for each hazardous constituent found in the groundwater as set forth in 335-14-5-.06(5);

Past activities at the CFI site have resulted in an impact to the shallow groundwater by the organic wood treating constituents that formed the creosote and pentachlorophenol preservative mixtures. CFI has evaluated the health risk to potential receptors in *Health Risk-Based Action Levels for the CFI Mobile, Alabama Site* (Foster Wheeler, 1995), which was subsequently approved by the ADEM in correspondence dated May 23, 1996.

CFI proposes to use the default concentrations that ADEM includes in the final permit. It is CFI's belief that any alternative concentration limits will not be met within the permit's 10-year time frame.

16.3 Groundwater Corrective Action

335-14-8-.02(5)(c)8(iii)Detailed plans and an engineering report describing the corrective action to be taken; and

CFI has implemented corrective action for the Mobile site. The Corrective Action Plan is included as Attachment R.

16.4 Groundwater Monitoring Program Effectiveness

335-14-8-.02(5)(c)8(iv) A description of how the groundwater monitoring program will demonstrate the adequacy of the corrective action.

CFI employs a separate groundwater monitoring system for each of two water-bearing soil horizons that underlie the Mobile facility. These groundwater monitoring systems monitor the shallow groundwater quality in both the Upper Aquifer and the Lower Aquifer.

The groundwater monitoring system uses a common upgradient well, well UG-2, which is located south of the office and north of the Hazardous Waste Management Area. The well serves both aquifers as an upgradient well since the confining clay aquitard is not present in this area and the two aquifers appear to be hydraulically connected.

The facility will use additional wells to monitor the groundwater in the vicinity of the closed units and hydraulically downgradient. These wells will consist of the proposed point of compliance wells as required in ADEM Administrative Rule 335-14-5-.06(6), and additionally, corrective action effectiveness wells and contaminant plume boundary wells.

CFI has proposed four (4) point of compliance wells for the Upper Aquifer and four (4) point of compliance wells for the Lower Aquifer. These wells are located near the outer perimeter of the Hazardous Waste Management Area and will be used to evaluate releases from the closed units.

CFI has proposed corrective action effectiveness wells to monitor the performance of the corrective action. They will be useful in determining:

- the internal plume contaminant concentration,
- the contaminant concentration gradients within the plume,
- changes in the contaminant concentration within the plume over time, and
- the effect of modifications to the corrective action design, either through planned changes or component failure.

CFI has proposed contaminant plume defining wells to monitor the outer (downgradient) extent of the contaminant plume. These wells will be useful in:

- demonstrating the effectiveness of the corrective action,
- evaluating the downgradient movement of the plume, and
- delineating the lateral limits of the contaminant plume downgradient of the hazardous waste management area.

CFI will maintain a network of piezometers at the site that will be used to monitor the water levels in the vicinity of the closed units. This data will be used to verify that the groundwater recovery system is effectively controlling the hydraulic gradients in the vicinity of the site and can be used to monitor hydraulic stresses associated with the corrective action components.

CFI's has conducted a statistical analysis of the groundwater monitoring data generated during the last three (3) years that can be used to determine what waste specific constituents, as identified through past Appendix IX analysis, are the best indicators of groundwater contaminants at this facility. The statistical analysis is provided in Attachment L of this application. The proposed groundwater monitoring program is further described in Attachment P.

16.5 Corrective Action Program Submittal Schedule

335-14-8-.02(5)(c)8(v) The permit may contain a schedule for submittal of the information required in 335-14-8-.02(5)(c)8.(iii) and (iv) provided the owner or operator obtains written authorization from the Department prior to submittal of the complete permit application.

A corrective action program has been implemented for the CFI site. A copy of the Corrective Action Plan is provided as Attachment R.

17.0 SOLID WASTE MANAGEMENT UNITS

335-14-8-.02(5)(d)Information requirements for solid waste management units.

1. The following information is required for each solid waste management unit at a facility seeking a permit:

(i) **The location of the unit on the topographic map required under 335-14-8-.02(5)(b)19.**

Figure 32 and Figure S-1 are site maps which depicts the location of each solid waste management unit identified at the Mobile site.

(ii) **Designation of type of unit.**

(iii) General dimensions and structural description (supply any available drawings).

(iv) When the unit was operated.

(v) **Specification of all wastes that have been managed at the unit, to the extent available.**

See Table S-1 for a summary of solid waste management unit information, including the name and number of each unit, the general dimensions, operational time frame and type of waste managed.

2. The owner or operator of any facility containing one or more solid waste management units must submit all available information pertaining to any release of hazardous wastes or hazardous constituents from such unit or units.

See Attachment S.

3. The owner/operator must conduct and provide the results of sampling and analysis of groundwater, land surface, and subsurface strata, surface water, or air which may include the installation of wells, where the Department ascertains it is necessary to complete a RCRA Facility Assessment that will determine if a more complete investigation is necessary.

See Attachment S.

4. The owner or operator must provide documentation of compliance with the requirements of the Uniform Environmental Covenants Program in ADEM Admin. Code div. 335-5 for all solid waste management units and areas of concern (including regulated units) for which remediation does not achieve the standard of unrestricted use.

See Attachment S.

RE: Quality Assurance Monitoring and Certification,
Cavenham Mobile Phase II Closure Construction,
Mobile, Alabama
File 88-2021

Gentlemen:

Soil Testing Engineers, Inc. by Charles S. Hedges, an Alabama licensed professional engineer specializing and experienced in geotechnical engineering, hereby certifies that the Phase II Closure has been constructed in general accordance with the plans and specifications issued September 20, 1988 except as discussed within the QA report. The exceptions noted in the QA report were changes made and approved by Cavenham Forest Industries as the actual construction proceeded.

This certification is based on full-time field QA monitoring performed by Soil Testing Engineers, Inc.

The professional engineer's certification comprises a declaration of his professional judgement. It does not constitute a warranty or guarantee, expressed or implied, by Soil Testing Engineers, Inc., or the signer. This certification is made under the EPA guidelines published in the Federal Register, July 26, 1982.

Very Truly Yours,

SOIL TESTING ENGINEERS, INC.

RE: FINAL PERMIT
NPDES PERMIT NUMBER AL0001104

Dear Mr. Woodyard:

Attached is the issued copy of the above referenced permit. Please note the permit limitations and conditions with which the permittee must comply. No comments were received on the draft permit during the public comment period.

Future monitoring data should be submitted in accordance with the conditions of your permit. Please see PART I.C for your reporting requirements. To reduce the paperwork burden for both the Department and the Permittee, when submitting the required Discharge Monitoring Reports (DMRs), please **do not submit** lab worksheets, logs, reports or other paperwork not specifically required by the permit unless requested by ADEM staff.

Please be aware that Part I.C.1.c of your permit requires that you participate in the Department's web-based electronic reporting system for submittal of DMRs upon issuance of this permit unless valid justification as to why you cannot participate has been submitted to and approved by the Department. The Department transitioned from the E2 Reporting System to the Alabama Environmental Permitting and Compliance System (AEPACS) for the submittal of DMRs on November 15, 2021. AEPACS is an electronic system that allows facilities to apply for and maintain permits as well as submit other required applications, registrations, and certifications. In addition, the system allows facilities to submit required compliance reports or other information to the Department. The Department has used the E2 User account information to set up a similar User Profile in AEPACS based on the following criteria:

1. The user has logged in to E2 since October 1, 2019; and
2. The E2 user account is set up using a unique email address.

E2 users that met the above criteria will only need to establish an ADEM Web Portal account (https://prd.adem.alabama.gov/awp) under the same email address as their E2 account to have the same permissions in AEPACS as they did in E2. They will also automatically be linked to the same facilities they were in E2.

If you have questions regarding this permit or monitoring requirements, please contact **Scott Jackson** by e-mail at **scott.jackson@adem.alabama.gov** or by phone at **(334) 394-4366**.

Sincerely,

Scott Ramsey, Chief

A. BEST MANAGEMENT PRACTICES (BMP) PLAN REQUIREMENTS 19

B. EFFLUENT TOXICITY LIMITATIONS AND BIOMONITORING REQUIREMENTS 21

PART I DISCHARGE LIMITATIONS, CONDITIONS, AND REQUIREMENTS

A. DISCHARGE LIMITATIONS AND MONITORING REQUIREMENTS

During the period beginning on the effective date of this permit and lasting through the expiration date of this permit, the permittee is authorized to discharge from the following point source(s) outfall(s), described more fully in the permittee's application:

DSN0011: Treated groundwater and contaminated storm water from groundwater and soil remediation. 3/

Such discharge shall be limited and monitored by the permittee as specified below:

Parameter	Quantity or Loading		Units	Quality or Concentration			Units	Sample Frequency	Sample Type	Seasonal
pH (00400) Effluent Gross Value	*****	*****	*****	6.0 Minimum Daily	*****	8.5 Maximum Daily	S.U.	Weekly	Grab	All Months
Carbon, Tot Organic (TOC) (00680) Effluent Gross Value	*****	*****	*****	*****	(Report) Monthly Average	(Report) Maximum Daily	mg/l	2X Monthly	Composite	All Months
Flow, In Conduit or Thru Treatment Plant (50050) Effluent Gross Value	(Report) Monthly Average	(Report) Maximum Daily	MGD	*****	*****	*****	*****	Daily	Totalizer	All Months
Chemical Oxygen Demand (COD) (2) (81017) Effluent Gross Value	*****	*****	*****	*****	(Report) Monthly Average	(Report) Maximum Daily	mg/l	2X Monthly	Composite	All Months

THE DISCHARGE SHALL HAVE NO SHEEN, AND THERE SHALL BE NO DISCHARGE OF VISIBLE OIL, FLOATING SOLIDS OR VISIBLE FOAM IN OTHER THAN TRACE AMOUNTS.

1/ Samples collected to comply with the monitoring requirements specified above shall be collected at the following location: At the nearest accessible location just prior to discharge and after final treatment. Unless otherwise specified, composite samples shall be time composite samples collected using automatic sampling equipment or a minimum of eight (8) equal volume grab samples collected over equal time intervals. All composite samples shall be collected for the total period of discharge not to exceed 24 hours.

2/ If only one sampling event occurs during a month, the sample result shall be reported on the discharge monitoring report as both the monthly average and daily maximum value for all parameters with a monthly average limitation.

3/ See Part IV.A for Best Management Practices (BMP) Plan Requirements.

During the period beginning on the effective date of this permit and lasting through the expiration date of this permit, the permittee is authorized to discharge from the following point source(s) outfall(s), described more fully in the permittee's application:

DSN001T: Treated groundwater and contaminated storm water from groundwater and soil remediation. 3/

Such discharge shall be limited and monitored by the permittee as specified below:

Parameter	Quantity or Loading		Units	Quality or Concentration			Units	Sample Frequency	Sample Type	Seasonal
P/F Stat 24Hr Acu Mysid. Bahia 4/ (TGE3E) Effluent Gross Value	*****	*****	*****	*****	*****	0 Single Sample	pass=0; fail=1	Quarterly	Grab	All Months
P/F Stat 24Hr Cyprinodon 4/ (TGE6A) Effluent Gross Value	*****	*****	*****	*****	*****	0 Single Sample	pass=0; fail=1	Quarterly	Grab	All Months

THE DISCHARGE SHALL HAVE NO SHEEN, AND THERE SHALL BE NO DISCHARGE OF VISIBLE OIL, FLOATING SOLIDS OR VISIBLE FOAM IN OTHER THAN TRACE AMOUNTS.

1/ Samples collected to comply with the monitoring requirements specified above shall be collected at the following location: At the nearest accessible location just prior to discharge and after final treatment. Unless otherwise specified, composite samples shall be time composite samples collected using automatic sampling equipment or a minimum of eight (8) equal volume grab samples collected over equal time intervals. All composite samples shall be collected for the total period of discharge not to exceed 24 hours.

2/ If only one sampling event occurs during a month, the sample result shall be reported on the discharge monitoring report as both the monthly average and daily maximum value for all parameters with a monthly average limitation.

3/ See Part IV.A for Best Management Practices (BMP) Plan Requirements.

4/ See Part IV.B for Effluent Toxicity Limitations and Biomonitoring Requirements.

B. DISCHARGE MONITORING AND RECORD KEEPING REQUIREMENTS

1. Representative Sampling

Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge and shall be in accordance with the provisions of this permit.

2. Test Procedures

For the purpose of reporting and compliance, permittees shall use one of the following procedures:

a. For parameters with an EPA established Minimum Level (ML), report the measured value if the analytical result is at or above the ML and report "0" for values below the ML. Test procedures for the analysis of pollutants shall conform to 40 CFR Part 136 and guidelines published pursuant to Section 304(h) of the FWPCA, 33 U.S.C. Section 1314(h). If more than one method for analysis of a substance is approved for use, a method having a minimum level lower than the permit limit shall be used. If the minimum level of all methods is higher than the permit limit, the method having the lowest minimum level shall be used and a report of less than the minimum level shall be reported as zero and will constitute compliance; however, should EPA approve a method with a lower minimum level during the term of this permit the permittee shall use the newly approved method.

b. For pollutants parameters without an established ML, an interim ML may be utilized. The interim ML shall be calculated as 3.18 times the Method Detection Level (MDL) calculated pursuant to 40 CFR Part 136, Appendix B.

Permittees may develop an effluent matrix-specific ML, where an effluent matrix prevents attainment of the established ML. However, a matrix specific ML shall be based upon proper laboratory method and technique. Matrix-specific MLs must be approved by the Department, and may be developed by the permittee during permit issuance, reissuance, modification, or during compliance schedule.

In either case the measured value should be reported if the analytical result is at or above the ML and "0" reported for values below the ML.

c. For parameters without an EPA established ML, interim ML, or matrix-specific ML, a report of less than the detection limit shall constitute compliance if the detection limit of all analytical methods is higher than the permit limit using the most sensitive EPA approved method. For the purpose of calculating a monthly average, "0" shall be used for values reported less than the detection limit.

The Minimum Level utilized for procedures A and B above shall be reported on the permittee's DMR. When an EPA approved test procedure for analysis of a pollutant does not exist, the Director shall approve the procedure to be used.

3. Recording of Results

For each measurement or sample taken pursuant to the requirements of this permit, the permittee shall record the following information:

a. The facility name and location, point source number, date, time and exact place of sampling:

b. The name(s) of person(s) who obtained the samples or measurements;

c. The dates and times the analyses were performed;

d. The name(s) of the person(s) who performed the analyses;

e. The analytical techniques or methods used, including source of method and method number; and

f. The results of all required analyses.

4. Records Retention and Production

The permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by the permit, and records of all data used to complete the above reports or the application for this permit, for a period of at least three years from the date of the sample measurement, report or application. This period may be extended by request of the Director at any time. If litigation or other enforcement action, under the AWPCA and/or the FWPCA, is ongoing which involves any of the above records, the records shall be kept until the litigation is resolved. Upon the written request of the Director or his designee, the permittee shall provide the Director with a copy of any record required to be retained by this paragraph. Copies of these records shall not be submitted unless requested.

All records required to be kept for a period of three years shall be kept at the permitted facility or an alternate location approved by the Department in writing and shall be available for inspection.

5. Monitoring Equipment and Instrumentation

All equipment and instrumentation used to determine compliance with the requirements of this permit shall be installed, maintained, and calibrated in accordance with the manufacturer's instructions or, in the absence of manufacturer's instructions, in accordance with accepted practices. The permittee shall develop and maintain quality assurance procedures to ensure proper operation and maintenance of all equipment and instrumentation. The quality assurance procedures shall include the proper use, maintenance, and installation, when appropriate, of monitoring equipment at the plant site.

C. DISCHARGE REPORTING REQUIREMENTS

1. Reporting of Monitoring Requirements

a. The permittee shall conduct the required monitoring in accordance with the following schedule:

MONITORING REQUIRED MORE FREQUENTLY THAN MONTHLY AND MONTHLY shall be conducted during the first full month following the effective date of coverage under this permit and every month thereafter.

QUARTERLY MONITORING shall be conducted at least once during each calendar quarter. Calendar quarters are the periods of January through March, April through June, July through September, and October through December. The permittee shall conduct the quarterly monitoring during the first complete calendar quarter following the effective date of this permit and is then required to monitor once during each quarter thereafter. Quarterly monitoring may be done anytime during the quarter, unless restricted elsewhere in this permit, but it should be submitted with the last DMR due for the quarter, i.e., (March, June, September and December DMR's).

SEMIANNUAL MONITORING shall be conducted at least once during the period of January through June and at least once during the period of July through December. The permittee shall conduct the semiannual monitoring during the first complete calendar semiannual period following the effective date of this permit and is then required to monitor once during each semiannual period thereafter. Semiannual monitoring may be done anytime during the semiannual period, unless restricted elsewhere in this permit, but it should be submitted with the last DMR for the month of the semiannual period, i.e. (June and December DMR's).

ANNUAL MONITORING shall be conducted at least once during the period of January through December. The permittee shall conduct the annual monitoring during the first complete calendar annual period following the effective date of this permit and is then required to monitor once during each annual period thereafter. Annual monitoring may be done anytime during the year, unless restricted elsewhere in this permit, but it should be submitted with the December DMR.

b. The permittee shall submit discharge monitoring reports (DMRs) on the forms provided by the Department and in accordance with the following schedule:

REPORTS OF MORE FREQUENTLY THAN MONTHLY AND MONTHLY TESTING shall be submitted on a **monthly** basis. The first report is due on the **28th day of May, 2022.** The reports shall be submitted so that they are received by the Department no later than the 28th day of the month following the reporting period.

REPORTS OF QUARTERLY TESTING shall be submitted on a **quarterly** basis. The first report is due on the **28th day of July, 2022.** The reports shall be submitted so that they are received by the Department no later than the 28th day of the month following the reporting period.

REPORTS OF SEMIANNUAL TESTING shall be submitted on a semiannual basis. The reports are due on the 28th day of JANUARY and the 28th day of JULY. The reports shall be submitted so that they are received by the Department no later than the 28th day of the month following the reporting period.

REPORTS OF ANNUAL TESTING shall be submitted on an annual basis. The first report is due on the 28th day of JANUARY. The reports shall be submitted so that they are received by the Department no later than the 28th day of the month following the reporting period.

c. Except as allowed by Provision I.C.1.c.(1) or (2), the permittee shall submit all Discharge Monitoring Reports (DMRs) required by Provision I.C.1.b electronically.

(1) If the permittee is unable to complete the electronic submittal of DMR data due to technical problems originating with the Department's electronic system (this could include entry/submittal issues with an entire set of DMRs or individual parameters), the permittee is not relieved of their obligation to submit DMR data to the Department by the date specified in Provision I.C.1.b, unless otherwise directed by the Department.

If the Department's electronic system is down on the 28th day of the month in which the DMR is due or is down for an extended period of time, as determined by the Department, when a DMR is required to be submitted, the permittee may submit the data in an alternate manner and format acceptable to the Department. Preapproved alternate acceptable methods include faxing, e-mailing, mailing, or hand-delivery of data such that they are received by the required reporting date. Within 5 calendar days of the Department's electronic system resuming operation, the permittee shall enter the data into the Department's electronic system, unless an alternate timeframe is approved by the Department. A comment should be included on the electronic DMR submittal verifying the original submittal date (date of the fax, copy of the dated e-mail, or hand-delivery stamped date), if applicable.

(2) The permittee may submit a request to the Department for a temporary electronic reporting waiver for DMR submittals. The waiver request should include the permit number; permittee name; facility/site name; facility address; name, address, and contact information for the responsible official or duly authorized representative; a detailed statement regarding the basis for requesting such a waiver; and the duration for which the waiver is requested. Approved electronic reporting waivers are not transferrable.

Permittees with an approved electronic reporting waiver for DMRs may submit hard copy DMRs for the period that the approved electronic reporting waiver request is effective. The permittee shall submit the Department-approved DMR forms to the address listed in Provision I.C.1.e.

(3) If a permittee is allowed to submit a hard copy DMR, the DMR must be legible and bear an original signature. Photo and electronic copies of the signature are not acceptable and shall not satisfy the reporting requirements of this permit.

(4) If the permittee, using approved analytical methods as specified in Provision I.B.2, monitors any discharge from a point source for a limited substance identified in Provision I.A. of this permit more frequently than required by this permit, the results of such monitoring shall be included in the calculation and reporting of values on the DMR and the increased frequency shall be indicated on the DMR.

(5) In the event no discharge from a point source identified in Provision I.A. of this permit and described more fully in the permittee's application occurs during a monitoring period, the permittee shall report "No Discharge" for such period on the appropriate DMR.

d. All reports and forms required to be submitted by this permit, the AWPCA and the Department's Rules, shall be electronically signed (or, if allowed by the Department, traditionally signed) by a "responsible official" of the permittee as defined in ADEM Administrative Code Rule 335-6-6-.09 or a "duly authorized representative" of such official as defined in ADEM Administrative Code Rule 335-6-6-.09 and shall bear the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

e. Discharge Monitoring Reports required by this permit, the AWPCA, and the Department's Rules that are being submitted in hard copy shall be addressed to:

Alabama Department of Environmental Management
Permits and Services Division
Environmental Data Section
Post Office Box 301463
Montgomery, Alabama 36130-1463

Certified and Registered Mail containing Discharge Monitoring Reports shall be addressed to:

Alabama Department of Environmental Management
Permits and Services Division
Environmental Data Section
1400 Coliseum Boulevard
Montgomery, Alabama 36110-2400

f. All other correspondence and reports required to be submitted by this permit, the AWPCA, and the Department's Rules shall be addressed to:

Alabama Department of Environmental Management
Water Division
Post Office Box 301463
Montgomery, Alabama 36130-1463

Certified and Registered Mail shall be addressed to:

Alabama Department of Environmental Management
Water Division
1400 Coliseum Boulevard
Montgomery, Alabama 36110-2400

g. If this permit is a re-issuance, then the permittee shall continue to submit DMRs in accordance with the requirements of their previous permit until such time as DMRs are due as discussed in Part I.C.1.b above.

2. Noncompliance Notification

a. 24-Hour Noncompliance Reporting

The permittee shall report to the Director, within 24-hours of becoming aware of the noncompliance, any noncompliance which may endanger health or the environment. This shall include but is not limited to the following circumstances:

(1) does not comply with any daily minimum or maximum discharge limitation for an effluent characteristic specified in Provision I. A. of this permit which is denoted by an "(X)";

(2) threatens human health or welfare, fish or aquatic life, or water quality standards;

(3) does not comply with an applicable toxic pollutant effluent standard or prohibition established under Section 307(a) of the FWPCA, 33 U.S.C. Section 1317(a);

(4) contains a quantity of a hazardous substance which has been determined may be harmful to public health or welfare under Section 311(b)(4) of the FWPCA, 33 U.S.C. Section 1321(b)(4);

(5) exceeds any discharge limitation for an effluent characteristic as a result of an unanticipated bypass or upset; and

(6) is an unpermitted direct or indirect discharge of a pollutant to a water of the state (unpermitted discharges properly reported to the Department under any other requirement are not required to be reported under this provision).

The permittee shall orally report the occurrence and circumstances of such discharge to the Director within 24-hours after the permittee becomes aware of the occurrence of such discharge. In addition to the oral report, the permittee shall submit to the Director or Designee a written report as provided in Part I.C.2.c no later than five (5) days after becoming aware of the occurrence of such discharge.

b. If for any reason, the permittee's discharge does not comply with any limitation of this permit, the permittee shall submit to the Director or Designee a written report as provided in Part I.C.2.c below, such report shall be submitted with the next Discharge Monitoring Report required to be submitted by Part I.C.1 of this permit after becoming aware of the occurrence of such noncompliance.

c. Any written report required to be submitted to the Director or Designee by Part I.C.2 a. or b. shall be submitted using a Noncompliance Notification Form (ADEM Form 421) available on the Department's website (http://adem.alabama.gov/DeptForms/Form421.pdf) and include the following information:

(1) A description of the discharge and cause of noncompliance;

(2) The period of noncompliance, including exact dates and times or, if not corrected, the anticipated time the noncompliance is expected to continue; and

(3) A description of the steps taken and/or being taken to reduce or eliminate the noncomplying discharge and to prevent its recurrence.

D. OTHER REPORTING AND NOTIFICATION REQUIREMENTS

1. Anticipated Noncompliance

   The permittee shall give the Director written advance notice of any planned changes or other circumstances regarding a facility which may result in noncompliance with permit requirements.

2. Termination of Discharge

   The permittee shall notify the Director, in writing, when all discharges from any point source(s) identified in Provision I. A. of this permit have permanently ceased. This notification shall serve as sufficient cause for instituting procedures for modification or termination of the permit.

3. Updating Information

   a. The permittee shall inform the Director of any change in the permittee's mailing address, telephone number or in the permittee's designation of a facility contact or office having the authority and responsibility to prevent and abate violations of the AWPCA, the Department's Rules, and the terms and conditions of this permit, in writing, no later than ten (10) days after such change. Upon request of the Director or his designee, the permittee shall furnish the Director with an update of any information provided in the permit application.

   b. If the permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Director, it shall promptly submit such facts or information with a written explanation for the mistake and/or omission.

4. Duty to Provide Information

   The permittee shall furnish to the Director, within a reasonable time, any information which the Director or his designee may request to determine whether cause exists for modifying, revoking and re-issuing, suspending, or terminating this permit, in whole or in part, or to determine compliance with this permit.

5. Cooling Water and Boiler Water Additives

   a. The permittee shall notify the Director in writing not later than thirty (30) days prior to instituting the use of any biocide corrosion inhibitor or chemical additive in a cooling or boiler system, not identified in the application for this permit, from which discharge is allowed by this permit. Notification is not required for additives that do not contain a heavy metal(s) as an active ingredient and that pass through a wastewater treatment system prior to discharge nor is notification required for additives that should not reasonably be expected to cause the cooling water or boiler water to exhibit toxicity as determined by analysis of manufacturer's data or testing by the permittee. Such notification shall include:

      (1) name and general composition of biocide or chemical;

      (2) 96-hour median tolerance limit data for organisms representative of the biota of the waterway into which the discharge will ultimately reach;

      (3) quantities to be used;

      (4) frequencies of use;

      (5) proposed discharge concentrations; and

      (6) EPA registration number, if applicable.

   b. The use of a biocide or additive containing tributyl tin, tributyl tin oxide, zinc, chromium or related compounds in cooling or boiler system(s), from which a discharge regulated by this permit occurs, is prohibited except as exempted below. The use of a biocide or additive containing zinc, chromium or related compounds may be used in special circumstances if (1) the permit contains limits for these substances, or (2) the applicant demonstrates during the application process that the use of zinc, chromium or related compounds as a biocide or additive will not pose a reasonable potential to violate the applicable State water quality standards for these substances. The use of any additive, not identified in this permit or in the application for this permit or not exempted from notification under this permit is prohibited, prior to a determination by the Department that permit modification to control discharge of the additive is not required or prior to issuance of a permit modification controlling discharge of the additive.

6. Permit Issued Based On Estimated Characteristics

a. If this permit was issued based on estimates of the characteristics of a process discharge reported on an EPA NPDES Application Form 2D (EPA Form 3510-2D), the permittee shall complete and submit an EPA NPDES Application Form 2C (EPA Form 3510-2C) no later than two years after the date that discharge begins. Sampling required for completion of the Form 2C shall occur when a discharge(s) from the process(s) causing the new or increased discharge is occurring. If this permit was issued based on estimates concerning the composition of a stormwater discharge(s), the permittee shall perform the sampling required by EPA NPDES Application Form 2F (EPA Form 3510-2F) no later than one year after the industrial activity generating the stormwater discharge has been fully initiated.

b. This permit shall be reopened if required to address any new information resulting from the completion and submittal of the Form 2C and or 2F.

E. SCHEDULE OF COMPLIANCE

1. The permittee shall achieve compliance with the discharge limitations specified in Provision I. A. in accordance with the following schedule:

COMPLIANCE SHALL BE ATTAINED ON THE EFFECTIVE DATE OF THIS PERMIT

2. No later than 14 calendar days following a date identified in the above schedule of compliance, the permittee shall submit either a report of progress or, in the case of specific actions being required by identified dates, a written notice of compliance or noncompliance. In the latter case, the notice shall include the cause of noncompliance, any remedial actions taken, and the probability of meeting the next scheduled requirement.

PART II OTHER REQUIREMENTS, RESPONSIBILITIES, AND DUTIES

A. OPERATIONAL AND MANAGEMENT REQUIREMENTS

1. Facilities Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of the permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities only when necessary to achieve compliance with the conditions of the permit.

2. Best Management Practices

a. Dilution water shall not be added to achieve compliance with discharge limitations except when the Director or his designee has granted prior written authorization for dilution to meet water quality requirements.

b. The permittee shall prepare, implement, and maintain a Spill Prevention, Control and Countermeasures (SPCC) Plan in accordance with 40 C.F.R. Section 112 if required thereby.

c. The permittee shall prepare, submit for approval and implement a Best Management Practices (BMP) Plan for containment of any or all process liquids or solids, in a manner such that these materials do not present a significant potential for discharge, if so required by the Director or his designee. When submitted and approved, the BMP Plan shall become a part of this permit and all requirements of the BMP Plan shall become requirements of this permit.

3. Spill Prevention, Control, and Management

The permittee shall provide spill prevention, control, and/or management sufficient to prevent any spills of pollutants from entering a water of the state or a publicly or privately owned treatment works. Any containment system used to implement this requirement shall be constructed of materials compatible with the substance(s) contained and which shall prevent the contamination of groundwater and such containment system shall be capable of retaining a volume equal to 110 percent of the capacity of the largest tank for which containment is provided.

B. OTHER RESPONSIBILITIES

1. Duty to Mitigate Adverse Impacts

The permittee shall promptly take all reasonable steps to mitigate and minimize or prevent any adverse impact on human health or the environment resulting from noncompliance with any discharge limitation specified in Provision I. A. of this permit, including such accelerated or additional monitoring of the discharge and/or the receiving waterbody as necessary to determine the nature and impact of the noncomplying discharge.

2. Right of Entry and Inspection

The permittee shall allow the Director, or an authorized representative, upon the presentation of proper credentials and other documents as may be required by law to:

a. enter upon the permittee's premises where a regulated facility or activity or point source is located or conducted, or where records must be kept under the conditions of the permit;

b. have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit:

c. inspect any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under the permit; and

d. sample or monitor, for the purposes of assuring permit compliance or as otherwise authorized by the AWPCA, any substances or parameters at any location.

C. BYPASS AND UPSET

1. Bypass

a. Any bypass is prohibited except as provided in b. and c. below:

b. A bypass is not prohibited if:

(1) It does not cause any discharge limitation specified in Provision I. A. of this permit to be exceeded;

(2) It enters the same receiving stream as the permitted outfall; and

(3) It is necessary for essential maintenance of a treatment or control facility or system to assure efficient operation of such facility or system.

c. A bypass is not prohibited and need not meet the discharge limitations specified in Provision I. A. of this permit if:

(1) It is unavoidable to prevent loss of life, personal injury, or severe property damage;

(2) There are no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime (this condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance); and

(3) The permittee submits a written request for authorization to bypass to the Director at least ten (10) days prior to the anticipated bypass (if possible), the permittee is granted such authorization, and the permittee complies with any conditions imposed by the Director to minimize any adverse impact on human health or the environment resulting from the bypass.

d. The permittee has the burden of establishing that each of the conditions of Provision II.C.1.b. or c. have been met to qualify for an exception to the general prohibition against bypassing contained in a. and an exemption, where applicable, from the discharge limitations specified in Provision I. A. of this permit.

2. Upset

a. A discharge which results from an upset need not meet the discharge limitations specified in Provision I. A. of this permit if:

(1) No later than 24-hours after becoming aware of the occurrence of the upset, the permittee orally reports the occurrence and circumstances of the upset to the Director or his designee; and

(2) No later than five (5) days after becoming aware of the occurrence of the upset, the permittee furnishes the Director with evidence, including properly signed, contemporaneous operating logs, or other relevant evidence, demonstrating that (i) an upset occurred; (ii) the permittee can identify the specific cause(s) of the upset; (iii) the permittee's facility was being properly operated at the time of the upset; and (iv) the permittee promptly took all reasonable steps to minimize any adverse impact on human health or the environment resulting from the upset.

b. The permittee has the burden of establishing that each of the conditions of Provision II. C.2.a. of this permit have been met to qualify for an exemption from the discharge limitations specified in Provision I.A. of this permit.

D. DUTY TO COMPLY WITH PERMIT, RULES, AND STATUTES

1. Duty to Comply

a. The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the AWPCA and the FWPCA and is grounds for enforcement action, for permit termination, revocation and reissuance, suspension, modification; or denial of a permit renewal application.

b. The necessity to halt or reduce production or other activities in order to maintain compliance with the conditions of the permit shall not be a defense for a permittee in an enforcement action.

c. The discharge of a pollutant from a source not specifically identified in the permit application for this permit and not specifically included in the description of an outfall in this permit is not authorized and shall constitute noncompliance with this permit.

d. The permittee shall take all reasonable steps, including cessation of production or other activities, to minimize or prevent any violation of this permit or to minimize or prevent any adverse impact of any permit violation.

e. Nothing in this permit shall be construed to preclude and negate the permittee's responsibility or liability to apply for, obtain, or comply with other ADEM, Federal, State, or Local Government permits, certifications, licenses, or other approvals.

2. Removed Substances

Solids, sludges, filter backwash, or any other pollutant or other waste removed in the course of treatment or control of wastewaters shall be disposed of in a manner that complies with all applicable Department Rules.

3. Loss or Failure of Treatment Facilities

Upon the loss or failure of any treatment facilities. including but not limited to the loss or failure of the primary source of power of the treatment facility, the permittee shall, where necessary to maintain compliance with the discharge limitations specified in Provision I. A. of this permit, or any other terms or conditions of this permit, cease, reduce, or otherwise control production and/or all discharges until treatment is restored. If control of discharge during loss or failure of the primary source of power is to be accomplished by means of alternate power sources, standby generators, or retention of inadequately treated effluent, the permittee must furnish to the Director within six months a certification that such control mechanisms have been installed.

4. Compliance with Statutes and Rules

a. This permit has been issued under ADEM Administrative Code, Chapter 335-6-6. All provisions of this chapter, that are applicable to this permit, are hereby made a part of this permit. A copy of this chapter may be obtained for a small charge from the Office of General Counsel, Alabama Department of Environmental Management, 1400 Coliseum Blvd., Montgomery, AL 36130.

b. This permit does not authorize the noncompliance with or violation of any Laws of the State of Alabama or the United States of America or any regulations or rules implementing such laws. FWPCA, 33 U.S.C. Section 1319, and Code of Alabama 1975, Section 22-22-14.

E. PERMIT TRANSFER, MODIFICATION, SUSPENSION, REVOCATION, AND REISSUANCE

1. Duty to Reapply or Notify of Intent to Cease Discharge

a. If the permittee intends to continue to discharge beyond the expiration date of this permit, the permittee shall file a complete permit application for reissuance of this permit at least 180 days prior to its expiration. If the permittee does not intend to continue discharge beyond the expiration of this permit, the permittee shall submit written notification of this intent which shall be signed by an individual meeting the signatory requirements for a permit application as set forth in ADEM Administrative Code Rule 335-6-6-.09.

b. Failure of the permittee to apply for reissuance at least 180 days prior to permit expiration will void the automatic continuation of the expiring permit provided by ADEM Administrative Code Rule 335-6-6-.06 and should the permit not be reissued for any reason any discharge after expiration of this permit will be an unpermitted discharge.

2. Change in Discharge

a. The permittee shall apply for a permit modification at least 180 days in advance of any facility expansion, production increase, process change, or other action that could result in the discharge of additional pollutants or increase the quantity of a discharged pollutant such that existing permit limitations would be exceeded or that could result in an additional discharge point. This requirement applies to pollutants that are or that are not subject to discharge limitations in this permit. No new or increased discharge may begin until the Director has authorized it by issuance of a permit modification or a reissued permit.

b. The permittee shall notify the Director as soon as it is known or there is reason to believe:

(1) That any activity has occurred or will occur which would result in the discharge on a routine or frequent basis, of any toxic pollutant which is not limited in this permit, if that discharge will exceed the highest of the following notification levels:

(a) one hundred micrograms per liter:

(b) two hundred micrograms per liter for acrolein and acrylonitrile; five hundred micrograms per liter for 2,4-dinitrophenol and for 2-methyl-4,6-dini-trophenol; and one milligram per liter for antimony:

(c) five times the maximum concentration value reported for that pollutant in the permit application; or

(2) That any activity has occurred or will occur which would result in any discharge, on a non-routine or infrequent basis, of a toxic pollutant which is not limited in the permit, if that discharge will exceed the highest of the following notification levels:

(a) five hundred micrograms per liter;

(b) one milligram per liter for antimony:

(c) ten times the maximum concentration value reported for that pollutant in the permit application

3. Transfer of Permit

This permit may not be transferred or the name of the permittee changed without notice to the Director and subsequent modification or revocation and reissuance of the permit to identify the new permittee and to incorporate any other changes as may be required under the FWPCA or AWPCA. In the case of a change in name, ownership or control of the permittee's premises only, a request for permit modification in a format acceptable to the Director is required at least 30 days prior to the change. In the case of a change in name, ownership or control of the permittee's premises accompanied by a change or proposed change in effluent characteristics, a complete permit application is required to be submitted to the Director at least 180 days prior to the change. Whenever the Director is notified of a change in name, ownership or control, he may decide not to modify the existing permit and require the submission of a new permit application.

4. Permit Modification and Revocation

a. This permit may be modified or revoked and reissued, in whole or in part, during its term for cause, including but not limited to, the following:

(1) If cause for termination under Provision II. E. 5. of this permit exists, the Director may choose to revoke and reissue this permit instead of terminating the permit:

(2) If a request to transfer this permit has been received, the Director may decide to revoke and reissue or to modify the permit; or

(3) If modification or revocation and reissuance is requested by the permittee and cause exists, the Director may grant the request.

b. This permit may be modified during its term for cause, including but not limited to, the following:

(1) If cause for termination under Provision II. E. 5. of this permit exists, the Director may choose to modify this permit instead of terminating this permit;

(2) There are material and substantial alterations or additions to the facility or activity generating wastewater which occurred after permit issuance which justify the application of permit conditions that are different or absent in the existing permit;

(3) The Director has received new information that was not available at the time of permit issuance and that would have justified the application of different permit conditions at the time of issuance;

(4) A new or revised requirement(s) of any applicable standard or limitation is promulgated under Sections 301(b)(2)(C), (D), (E), and (F), and 307(a)(2) of the FWPCA;

(5) Errors in calculation of discharge limitations or typographical or clerical errors were made;

(6) To the extent allowed by ADEM Administrative Code, Rule 335-6-6-.17, when the standards or regulations on which the permit was based have been changed by promulgation of amended standards or regulations or by judicial decision after the permit was issued;

(7) To the extent allowed by ADEM Administrative Code, Rule 335-6-6-.17, permits may be modified to change compliance schedules;

(8) To agree with a granted variance under 30l(c), 30l(g), 30l(h), 30l(k), or 3l6(a) of the FWPCA or for fundamentally different factors;

(9) To incorporate an applicable 307(a) FWPCA toxic effluent standard or prohibition;

(10) When required by the reopener conditions in this permit;

(11) When required under 40 CFR 403.8(e) (compliance schedule for development of pretreatment program);

(12) Upon failure of the state to notify, as required by Section 402(b)(3) of the FWPCA, another state whose waters may be affected by a discharge permitted by this permit;

(13) When required to correct technical mistakes, such as errors in calculation, or mistaken interpretations of law made in determining permit conditions; or

(14) When requested by the permittee and the Director determines that the modification has cause and will not result in a violation of federal or state law, regulations or rules.

5. Permit Termination

This permit may be terminated during its term for cause, including but not limited to, the following:

a. Violation of any term or condition of this permit;

b. The permittee's misrepresentation or failure to disclose fully all relevant facts in the permit application or during the permit issuance process or the permittee's misrepresentation of any relevant facts at any time;

c. Materially false or inaccurate statements or information in the permit application or the permit;

d. A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge;

e. The permittee's discharge threatens human life or welfare or the maintenance of water quality standards;

f. Permanent closure of the facility generating the wastewater permitted to be discharged by this permit or permanent cessation of wastewater discharge;

g. New or revised requirements of any applicable standard or limitation that is promulgated under Sections 301(b)(2)(C), (D), (E), and (F), and 307(a)(2) of the FWPCA that the Director determines cannot be complied with by the permittee; or

h. Any other cause allowed by the ADEM Administrative Code, Chapter 335-6-6.

6. Permit Suspension

This permit may be suspended during its term for noncompliance until the permittee has taken action(s) necessary to achieve compliance.

7. Request for Permit Action Does Not Stay Any Permit Requirement

The filing of a request by the permittee for modification, suspension or revocation of this permit, in whole or in part, does not stay any permit term or condition.

F. COMPLIANCE WITH TOXIC POLLUTANT STANDARD OR PROHIBITION

If any applicable effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is established under Section 307(a) of the FWPCA, 33 U.S.C. Section 1317(a), for a toxic pollutant discharged by the permittee and such standard or prohibition is more stringent than any discharge limitation on the pollutant specified in Provision I. A. of this permit, or controls a pollutant not limited in Provision I. A. of this permit, this permit shall be modified to conform to the toxic pollutant effluent standard or prohibition and the permittee shall be notified of such modification. If this permit has not been modified to conform to the toxic pollutant effluent standard or prohibition before the effective date of such standard or prohibition, the permittee shall attain compliance with the requirements of the standard or prohibition within the time period required by the standard or prohibition and shall continue to comply with the standard or prohibition until this permit is modified or reissued.

G. DISCHARGE OF WASTEWATER GENERATED BY OTHERS

The discharge of wastewater, generated by any process, facility, or by any other means not under the operational control of the permittee or not identified in the application for this permit or not identified specifically in the description of an outfall in this permit is not authorized by this permit.

PART III OTHER PERMIT CONDITIONS

A. CIVIL AND CRIMINAL LIABILITY

1. Tampering

Any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained or performed under the permit shall, upon conviction, be subject to penalties as provided by the AWPCA.

2. False Statements

Any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be subject to penalties as provided by the AWPCA.

3. Permit Enforcement

a. Any NPDES permit issued or reissued by the Department is a permit for the purpose of the AWPCA and the FWPCA and as such any terms, conditions, or limitations of the permit are enforceable under state and federal law.

b. Any person required to have a NPDES permit pursuant to ADEM Administrative Code Chapter 335-6-6 and who discharges pollutants without said permit, who violates the conditions of said permit, who discharges pollutants in a manner not authorized by the permit, or who violates applicable orders of the Department or any applicable rule or standard of the Department, is subject to any one or combination of the following enforcement actions under applicable state statutes.

(1) An administrative order requiring abatement, compliance, mitigation, cessation, clean-up, and/or penalties;

(2) An action for damages;

(3) An action for injunctive relief: or

(4) An action for penalties.

c. If the permittee is not in compliance with the conditions of an expiring or expired permit the Director may choose to do any or all of the following provided the permittee has made a timely and complete application for reissuance of the permit:

(1) initiate enforcement action based upon the permit which has been continued;

(2) issue a notice of intent to deny the permit reissuance. If the permit is denied, the owner or operator would then be required to cease the activities authorized by the continued permit or be subject to enforcement action for operating without a permit;

(3) reissue the new permit with appropriate conditions; or

(4) take other actions authorized by these rules and AWPCA.

4. Relief from Liability

Except as provided in Provision II.C.1 (Bypass) and Provision II.C.2 (Upset), nothing in this permit shall be construed to relieve the permittee of civil or criminal liability under the AWPCA or FWPCA for noncompliance with any term or condition of this permit.

B. OIL AND HAZARDOUS SUBSTANCE LIABILITY

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities or penalties to which the permittee is or may be subject under Section 311 of the FWPCA, 33 U.S.C. Section 1321.

C. PROPERTY AND OTHER RIGHTS

This permit does not convey any property rights in either real or personal property, or any exclusive privileges, nor does it authorize any injury to persons or property or invasion of other private rights, trespass, or any infringement of federal, state, or local laws or regulations.

nor does it authorize or approve the construction of any physical structures or facilities or the undertaking of any work in any waters of the state or of the United States.

D. AVAILABILITY OF REPORTS

Except for data determined to be confidential under Code of Alabama 1975, Section 22-22-9(c), all reports prepared in accordance with the terms of this permit shall be available for public inspection at the offices of the Department. Effluent data shall not be considered confidential.

E. EXPIRATION OF PERMITS FOR NEW OR INCREASED DISCHARGES

1. If this permit was issued for a new discharger or new source, this permit shall expire eighteen months after the issuance date if construction of the facility has not begun during the eighteen-month period.

2. If this permit was issued or modified to allow the discharge of increased quantities of pollutants to accommodate the modification of an existing facility and if construction of this modification has not begun during the eighteen month period after issuance of this permit or permit modification, this permit shall be modified to reduce the quantities of pollutants allowed to be discharged to those levels that would have been allowed if the modification of the facility had not been planned.

3. Construction has begun when the owner or operator has:

   a. begun, or caused to begin as part of a continuous on-site construction program:

      (1) any placement, assembly, or installation of facilities or equipment; or

      (2) significant site preparation work including clearing, excavation, or removal of existing buildings, structures, or facilities which is necessary for the placement, assembly, or installation of new source facilities or equipment: or

   b. entered into a binding contractual obligation for the purpose of placement, assembly, or installation of facilities or equipment which are intended to be used in its operation within a reasonable time. Options to purchase or contracts which can be terminated or modified without substantial loss, and contracts for feasibility, engineering, and design studies do not constitute a contractual obligation under the paragraph. The entering into a lease with the State of Alabama for exploration and production of hydrocarbons shall also be considered beginning construction.

F. COMPLIANCE WITH WATER QUALITY STANDARDS

1. On the basis of the permittee's application, plans, or other available information, the Department has determined that compliance with the terms and conditions of this permit should assure compliance with the applicable water quality standards.

2. Compliance with permit terms and conditions notwithstanding, if the permittee's discharge(s) from point sources identified in Provision I. A. of this permit cause or contribute to a condition in contravention of state water quality standards, the Department may require abatement action to be taken by the permittee in emergency situations or modify the permit pursuant to the Department's Rules, or both.

3. If the Department determines, on the basis of a notice provided pursuant to this permit or any investigation, inspection or sampling, that a modification of this permit is necessary to assure maintenance of water quality standards or compliance with other provisions of the AWPCA or FWPCA, the Department may require such modification and, in cases of emergency, the Director may prohibit the discharge until the permit has been modified.

G. GROUNDWATER

Unless specifically authorized under this permit, this permit does not authorize the discharge of pollutants to groundwater. Should a threat of groundwater contamination occur, the Director may require groundwater monitoring to properly assess the degree of the problem and the Director may require that the Permittee undertake measures to abate any such discharge and/or contamination.

H. DEFINITIONS

1. Average monthly discharge limitation - means the highest allowable average of "daily discharges" over a calendar month, calculated as the sum of all "daily discharges" measured during a calendar month divided by the number of "daily discharges" measured during that month (zero discharge days shall not be included in the number of "daily discharges" measured and a less than detectable test result shall be treated as a concentration of zero if the most sensitive EPA approved method was used).

2. Average weekly discharge limitation - means the highest allowable average of "daily discharges" over a calendar week, calculated as the sum of all "daily discharges" measured during a calendar week divided by the number of "daily discharges"

measured during that week (zero discharge days shall not be included in the number of "daily discharges" measured and a less than detectable test result shall be treated as a concentration of zero if the most sensitive EPA approved method was used).

3. Arithmetic Mean – means the summation of the individual values of any set of values divided by the number of individual values.

4. AWPCA - means the Alabama Water Pollution Control Act.

5. BOD – means the five-day measure of the pollutant parameter biochemical oxygen demand.

6. Bypass - means the intentional diversion of waste streams from any portion of a treatment facility.

7. CBOD – means the five-day measure of the pollutant parameter carbonaceous biochemical oxygen demand.

8. Daily discharge - means the discharge of a pollutant measured during any consecutive 24-hour period in accordance with the sample type and analytical methodology specified by the discharge permit.

9. Daily maximum - means the highest value of any individual sample result obtained during a day.

10. Daily minimum - means the lowest value of any individual sample result obtained during a day.

11. Day - means any consecutive 24-hour period.

12. Department - means the Alabama Department of Environmental Management.

13. Director - means the Director of the Department.

14. Discharge - means "[t]he addition, introduction, leaking, spilling or emitting of any sewage, industrial waste, pollutant or other wastes into waters of the state". Code of Alabama 1975, Section 22-22-1(b)(8).

15. Discharge Monitoring Report (DMR) - means the form approved by the Director to accomplish reporting requirements of an NPDES permit.

16. DO – means dissolved oxygen.

17. 8HC – means 8-hour composite sample, including any of the following:

    a. The mixing of at least 5 equal volume samples collected at constant time intervals of not more than 2 hours over a period of not less than 8 hours between the hours of 6:00 a.m. and 6:00 p.m. If the sampling period exceeds 8 hours, sampling may be conducted beyond the 6:00 a.m. to 6:00 p.m. period.

    b. A sample continuously collected at a constant rate over period of not less than 8 hours between the hours of 6:00 a.m. and 6:00 p.m. If the sampling period exceeds 8 hours, sampling may be conducted beyond the 6:00 a.m. to 6:00 p.m. period.

18. EPA - means the United States Environmental Protection Agency.

19. FC – means the pollutant parameter fecal coliform.

20. Flow – means the total volume of discharge in a 24-hour period.

21. FWPCA - means the Federal Water Pollution Control Act.

22. Geometric Mean – means the Nth root of the product of the individual values of any set of values where N is equal to the number of individual values. The geometric mean is equivalent to the antilog of the arithmetic mean of the logarithms of the individual values. For purposes of calculating the geometric mean, values of zero (0) shall be considered one (1).

23. Grab Sample – means a single influent or effluent portion which is not a composite sample. The sample(s) shall be collected at the period(s) most representative of the discharge.

24. Indirect Discharger – means a nondomestic discharger who discharges pollutants to a publicly owned treatment works or a privately owned treatment facility operated by another person.

25. Industrial User – means those industries identified in the Standard Industrial Classification manual, Bureau of the Budget 1967, as amended and supplemented, under the category "Division D – Manufacturing" and such other classes of significant waste producers as, by regulation, the Director deems appropriate.

26. MGD – means million gallons per day.

27. Monthly Average – means, other than for fecal coliform bacteria, the arithmetic mean of the entire composite or grab samples taken for the daily discharges collected in one month period. The monthly average for fecal coliform bacteria is the geometric mean of daily discharge samples collected in a one month period. The monthly average for flow is the arithmetic mean of all flow measurements taken in a one month period.

28. New Discharger – means a person, owning or operating any building, structure, facility or installation:

    a. from which there is or may be a discharge of pollutants;

    b. that did not commence the discharge of pollutants prior to August 13, 1979, and which is not a new source; and

    c. which has never received a final effective NPDES permit for dischargers at that site.

29. NH3-N – means the pollutant parameter ammonia, measured as nitrogen.

30. Permit application - means forms and additional information that is required by ADEM Administrative Code Rule 335-6-6-.08 and applicable permit fees.

31. Point source - means "any discernible, confined and discrete conveyance, including but not limited to any pipe, channel, ditch, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, . . . from which pollutants are or may be discharged." Section 502(14) of the FWPCA, 33 U.S.C. Section 1362(14).

32. Pollutant - includes for purposes of this permit, but is not limited to, those pollutants specified in Code of Alabama 1975, Section 22-22-1(b)(3) and those effluent characteristics specified in Provision I. A. of this permit.

33. Privately Owned Treatment Works – means any devices or system which is used to treat wastes from any facility whose operator is not the operator of the treatment works, and which is not a "POTW".

34. Publicly Owned Treatment Works – means a wastewater collection and treatment facility owned by the State, municipality, regional entity composed of two or more municipalities, or another entity created by the State or local authority for the purpose of collecting and treating municipal wastewater.

35. Receiving Stream – means the "waters" receiving a "discharge" from a "point source".

36. Severe property damage - means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

37. Significant Source – means a source which discharges 0.025 MGD or more to a POTW or greater than five percent of the treatment work's capacity, or a source which is a primary industry as defined by the U.S. EPA or which discharges a priority or toxic pollutant.

38. Solvent – means any virgin, used or spent organic solvent(s) identified in the F-Listed wastes (F001 through F005) specified in 40 CFR 261.31 that is used for the purpose of solubilizing other materials.

39. TKN – means the pollutant parameter Total Kjeldahl Nitrogen.

40. TON – means the pollutant parameter Total Organic Nitrogen.

41. TRC – means Total Residual Chlorine.

42. TSS – means the pollutant parameter Total Suspended Solids.

43. 24HC – means 24-hour composite sample, including any of the following:

    a. the mixing of at least 12 equal volume samples collected at constant time intervals of not more than 2 hours over a period of 24 hours:

b. a sample collected over a consecutive 24-hour period using an automatic sampler composite to one sample. As a minimum, samples shall be collected hourly and each shall be no more than one twenty-fourth (1/24) of the total sample volume collected; or

c. a sample collected over a consecutive 24-hour period using an automatic composite sampler composited proportional to flow.

44. Upset - means an exceptional incident in which there is an unintentional and temporary noncompliance with technology-based permit discharge limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

45. Waters - means "[a]ll waters of any river, stream, watercourse, pond, lake, coastal, ground or surface water, wholly or partially within the state, natural or artificial. This does not include waters which are entirely confined and retained completely upon the property of a single individual, partnership or corporation unless such waters are used in interstate commerce." Code of Alabama 1975, Section 22-22-1(b)(2). Waters "include all navigable waters" as defined in Section 502(7) of the FWPCA, 22 U.S.C. Section 1362(7), which are within the State of Alabama.

46. Week - means the period beginning at twelve midnight Saturday and ending at twelve midnight the following Saturday.

47. Weekly (7-day and calendar week) Average – is the arithmetic mean of all samples collected during a consecutive 7-day period or calendar week, whichever is applicable. The calendar week is defined as beginning on Sunday and ending on Saturday. Weekly averages shall be calculated for all calendar weeks with Saturdays in the month. If a calendar week overlaps two months (i.e., the Sunday is in one month and the Saturday in the following month), the weekly average calculated for the calendar week shall be included in the data for the month that contains the Saturday.

I. SEVERABILITY

The provisions of this permit are severable, and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances, and the remainder of this permit, shall not be affected thereby.

PART IV ADDITIONAL REQUIREMENTS, CONDITIONS, AND LIMITATIONS

A. BEST MANAGEMENT PRACTICES (BMP) PLAN REQUIREMENTS

1. BMP Plan

The permittee shall develop and implement a Best Management Practices (BMP) Plan which prevents, or minimizes the potential for, the release of pollutants from ancillary activities, including material storage areas; plant site runoff; in-plant transfer, process and material handling areas; loading and unloading operations, and sludge and waste disposal areas, to the waters of the State through plant site runoff; spillage or leaks; sludge or waste disposal; or drainage from raw material storage.

2. Plan Content

The permittee shall prepare and implement a best management practices (BMP) plan, which shall:

a. Establish specific objectives for the control of pollutants:

(1) Each facility component or system shall be examined for its potential for causing a release of significant amounts of pollutants to waters of the State due to equipment failure, improper operation, natural phenomena such as rain or snowfall, etc.

(2) Where experience indicates a reasonable potential for equipment failure (e.g., a tank overflow or leakage), natural condition (e.g. precipitation), or circumstances to result in significant amounts of pollutants reaching surface waters, the plan should include a prediction of the direction, rate of flow, and total quantity of pollutants which could be discharged from the facility as a result of each condition or circumstance.

b. Establish specific best management practices to meet the objectives identified under paragraph a. of this section, addressing each component or system capable of causing a release of significant amounts of pollutants to the waters of the State, and identifying specific preventative or remedial measures to be implemented;

c. Establish a program to identify and repair leaking equipment items and damaged containment structures, which may contribute to contaminated stormwater runoff. This program must include regular visual inspections of equipment, containment structures and of the facility in general to ensure that the BMP is continually implemented and effective;

d. Prevent the spillage or loss of fluids, oil, grease, gasoline, etc. from vehicle and equipment maintenance activities and thereby prevent the contamination of stormwater from these substances;

e. Prevent or minimize stormwater contact with material stored on site;

f. Designate by position or name the person or persons responsible for the day to day implementation of the BMP;

g. Provide for routine inspections, on days during which the facility is manned, of any structures that function to prevent stormwater pollution or to remove pollutants from stormwater and of the facility in general to ensure that the BMP is continually implemented and effective;

h. Provide for the use and disposal of any material used to absorb spilled fluids that could contaminate stormwater;

i. Develop a solvent management plan, if solvents are used on site. The solvent management plan shall include as a minimum lists of the solvents on site; the disposal method of solvents used instead of dumping, such as reclamation, contract hauling; and the procedures for assuring that solvents do not routinely spill or leak into the stormwater;

j. Provide for the disposal of all used oils, hydraulic fluids, solvent degreasing material, etc. in accordance with good management practices and any applicable state or federal regulations;

k. Include a diagram of the facility showing the locations where stormwater exits the facility, the locations of any structure or other mechanisms intended to prevent pollution of stormwater or to remove pollutants from stormwater, the locations of any collection and handling systems;

l. Provide control sufficient to prevent or control pollution of stormwater by soil particles to the degree required to maintain compliance with the water quality standard for turbidity applicable to the waterbody(s) receiving discharge(s) under this permit;

m. Provide spill prevention, control, and/or management sufficient to prevent or minimize contaminated stormwater runoff. Any containment system used to implement this requirement shall be constructed of materials compatible with the substance(s) contained and shall prevent the contamination of groundwater. The containment system shall also be capable of retaining a volume equal to 110 percent of the capacity of the largest tank for which containment is provided:

n. Provide and maintain curbing, diking or other means of isolating process areas to the extent necessary to allow segregation and collection for treatment of contaminated stormwater from process areas;

o. Be reviewed by plant engineering staff and the plant manager; and

p. Bear the signature of the plant manager.

3. Compliance Schedule

The permittee shall have reviewed (and revised if necessary) and fully implemented the BMP plan as soon as practicable but no later than six months after the effective date of this permit.

4. Department Review

a. When requested by the Director or his designee, the permittee shall make the BMP available for Department review.

b. The Director or his designee may notify the permittee at any time that the BMP is deficient and require correction of the deficiency.

c. The permittee shall correct any BMP deficiency identified by the Director or his designee within 30 days of receipt of notification and shall certify to the Department that the correction has been made and implemented.

5. Administrative Procedures

a. A copy of the BMP shall be maintained at the facility and shall be available for inspection by representatives of the Department.

b. A log of the routine inspection required above shall be maintained at the facility and shall be available for inspection by representatives of the Department. The log shall contain records of all inspections performed for the last three years and each entry shall be signed by the person performing the inspection.

c. The permittee shall provide training for any personnel required to implement the BMP and shall retain documentation of such training at the facility. This documentation shall be available for inspection by representatives of the Department. Training shall be performed prior to the date that implementation of the BMP is required.

d. BMP Plan Modification. The permittee shall amend the BMP plan whenever there is a change in the facility or change in operation of the facility which materially increases the potential for the ancillary activities to result in a discharge of significant amounts of pollutants.

e. BMP Plan Review. The permittee shall complete a review and evaluation of the BMP plan at least once every three years from the date of preparation of the BMP plan. Documentation of the BMP Plan review and evaluation shall be signed and dated by the Plant Manager.

B. EFFLUENT TOXICITY LIMITATIONS AND BIOMONITORING REQUIREMENTS

1. The permittee shall perform 24-hour acute toxicity tests on the wastewater discharges required to be tested for acute toxicity by Part I of this permit.

   a. Test Requirements

      (1) The tests shall be performed using undiluted effluent.

      (2) Any test where survival in the effluent concentration is less than 90% and statistically lower than the control indicates acute toxicity and constitutes noncompliance with this permit.

   b. General Test Requirements:

      (1) A grab sample shall be obtained for use in above biomonitoring tests. The holding time for each sample shall not exceed 36 hours. The control water shall be a water prepared in the laboratory in accordance with the EPA procedure described in EPA 821-R-02-012 or most current edition or another control water selected by the permittee and approved by the Department.

      (2) Effluent toxicity tests in which the control survival is less than 90% or in which the other requirements of the EPA Test Procedure are not met shall be unacceptable and the permittee shall rerun the tests as soon as practical within the monitoring period.

      (3) In the event of an invalid test, upon subsequent completion of a valid test, the results of all tests, valid and invalid, are reported with an explanation of the tests performed and results.

   c. Reporting Requirements:

      (1) The permittee shall notify the Department in writing within 48 hours after toxicity has been demonstrated by the scheduled test(s).

      (2) Biomonitoring test results obtained during each monitoring period shall be summarized and reported using the appropriate Discharge Monitoring Report (DMR) form approved by the Department. In accordance with Section 2. of this part, an effluent toxicity report containing the information in Section 2. shall be included with the DMR. Two copies of the test results must be submitted to the Department no later than 28 days after the month in which the tests were performed.

   d. Additional Testing Requirements:

      (1) If acute toxicity is indicated (noncompliance with permit limit), the permittee shall perform four additional valid acute toxicity tests in accordance with these procedures to determine the extent and duration of the toxic condition. The toxicity tests shall be performed once per week and shall be performed during the first four calendar weeks following the date on which the permittee became aware of the permit noncompliance and the results of these tests shall be submitted no later than 28 days following the month in which the tests were performed.

      (2) After evaluation of the results of the follow-up tests, the Department will determine if additional action is appropriate and may require additional testing and/or toxicity reduction measures. The permittee may be required to perform a Toxicity Identification Evaluation (TIE) and/or a Toxicity Reduction Evaluation (TRE). The TIE/TRE shall be performed in accordance with the most recent protocols/guidance outlined by EPA (e.g., EPA/600/2-88/062, EPA/600/R-92/080, EPA/600R-92/081, EPA/833/B-99/022 and/or EPA/600/6-91/005F, etc.).

   e. Test Methods:

      (1) The tests shall be performed in accordance with the latest edition of the "EPA Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms" and shall be performed using the sheepshead minnow (*Cyprinidon variegatus*) and the mysid shrimp (*Mysidopsis bahia*).

2. Effluent toxicity testing reports

The following information shall be submitted with each discharge monitoring report unless otherwise directed by the Department. The Department may at any time suspend or reinstate this requirement or may increase or decrease the frequency of submittals.

a. Introduction

(1) Facility Name, location and county
(2) Permit number
(3) Toxicity testing requirements of permit
(4) Name of receiving water body
(5) Contract laboratory information (if tests are performed under contract)
  (a) Name of firm
  (b) Telephone number
  (c) Address
(6) Objective of test

b. Plant Operations

(1) Discharge operating schedule (if other than continuous)
(2) Volume of discharge during sample collection to include Mean daily discharge on sample collection date (MGD, CFS, GPM)
(3) Design flow of treatment facility at time of sampling

c. Source of Effluent and Dilution Water

(1) Effluent samples

  (a) Sampling point
  (b) Sample collection dates and times (to include composite sample start and finish times)
  (c) Sample collection method
  (d) Physical and chemical data of undiluted effluent samples (water temperature, pH, alkalinity, hardness, specific conductance, total residual chlorine (if applicable), etc.)
  (e) Sample temperature when received at the laboratory
  (f) Lapsed time from sample collection to delivery
  (g) Lapsed time from sample collection to test initiation

(2) Dilution Water Samples

  (a) Source
  (b) Collection date(s) and time(s) (where applicable)
  (c) Pretreatment
  (d) Physical and chemical characteristics (pH, hardness, water temperature, alkalinity, specific conductance, etc.)

d. Test Conditions

(1) Toxicity test method utilized
(2) End point(s) of test
(3) Deviations from referenced method, if any, and reason(s)
(4) Date and time test started
(5) Date and time test terminated
(6) Type and volume of test chambers
(7) Volume of solution per chamber
(8) Number of organisms per test chamber
(9) Number of replicate test chambers per treatment
(10) Test temperature, pH and dissolved oxygen as recommended by the method (to include ranges)
(11) Feeding frequency, and amount and type of food
(12) Light intensity (mean)

e. Test Organisms

(1) Scientific name
(2) Life stage and age
(3) Source
(4) Disease treatment (if applicable)

f. Quality Assurance

(1) Reference toxicant utilized and source
(2) Date and time of most recent acute reference toxicant test(s), raw data, and current cusum chart(s)
(3) Dilution water utilized in reference toxicant test
(4) Results of reference toxicant test(s) (LC50, etc.), report concentration-response relationship and evaluate test sensitivity. The most recent reference toxicant test shall be conducted within 30-days of the routine.
(5) Physical and chemical methods utilized

g. Results

(1) Provide raw toxicity data in tabular form, including daily records of affected organisms in each concentration (including controls) and replicate
(2) Provide table of endpoints: LC50, NOAEC, Pass/Fail (as required in the applicable NPDES permit)
(3) Indicate statistical methods used to calculate endpoints
(4) Provide all physical and chemical data required by method
(5) Results of test(s) (LC50, NOAEC, Pass/Fail, etc.), report concentration-response relationship **(definitive test only)**, report percent minimum significant difference (PMSD).

h. Conclusions and Recommendations

(1) Relationship between test endpoints and permit limits
(2) Action to be taken

1/ Adapted from "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms", Fifth Edition, October 2002 (EPA 821-R-02-012), Section 12, Report Preparation

WASTE ANALYSIS PLAN
Cavenham Forest Industries Inc.
Mobile, Alabama

1.0 INTRODUCTION

The Cavenham Forest Industries Inc. (CFI) Waste Analysis Plan is designed to satisfy the requirements of ADEM Administrative Code Rule: 335-14-5-.02(4)

During the post-closure care period this facility will not be accepting any waste from new (off-site) sources and the only on-site waste streams that may contain a hazardous component are:

- the recovered ground water from the gradient control system for the hazardous waste management area,
- the ground water recovered during corrective action of solid waste management units,
- waste wood treating oily sludge recovered from the ground water as part of treatment that occurs in the NPDES permitted on-site treatment system, and
- waste generated during treatment of the recovered ground water prior to NPDES discharge.

Recovered ground water is pumped automatically to the on-site water treatment system where it is treated and either used as injection water or discharged under CFI's NPDES permit for the Mobile facility.

At some point CFI will generate oily sludges and quantities of spent activated carbon from the treatment of the ground water prior to discharge. All waste generated at the site is handled and disposed according to state and federal requirements.

2.0 PARAMETERS AND FREQUENCY

The waste streams at the CFI Mobile facility do not require regular disposal at off-site facilities and thus characterization on a defined schedule is not relevant. The recovered ground water at the facility is characterized semi-annually as part of the ground water corrective action program. Other waste that is generated, for example from the water treatment system, will assumed to be hazardous until proven otherwise by testing.

Waste that is generated will be tested for the organic constituents of K001 waste. K001 is the only waste that was previously managed at the facility and can be easily analyzed using EPA

approved or equivalent analytical methods. All waste streams will be analyzed for Table C-1 parameters plus any additional parameters that might be required of the disposal facility.

Samples are collected prior to shipment of any wastes off-site. If multiple shipments are required annual characterization of the waste stream will be conducted. The sampling procedure described herein will be implemented throughout the duration of the post-closure period.

3.0 EQUIPMENT INVENTORY

An equipment inventory is conducted prior to sampling to ensure the availability of adequate sampling supplies. A sampling equipment checklist is provided in Table C-2. Immediately prior to each sampling event, the following procedures are undertaken:

- Sampling equipment that will come in contact with the sample is washed throughly with a laboratory detergent and rinsed thoroughly with distilled water.

- Sample containers are cleaned by the laboratory and the appropriate preservative is added according to the requirements listed in the section of this plan titled "Sample Preservation and Shipment."

4.0 SAMPLE COLLECTION

Most samples will be grab samples; however, sometimes a composite sample may be required. Composite samples will be collected by filling two (2) one liter sample containers with (8) eight equal portions of liquid, collected over a continuous eight (8) hour period. Sample containers are completely filled and sealed. Extreme care should be taken to avoid agitation of the sample during the transfer.

Immediately following collection, all samples are placed in ice chests containing ice or ice packs and shipped immediately to the off-site contract laboratory. Any ice chests to be shipped off-site are strapped with packing tape to prevent opening during shipment, and are properly addressed and identified using approved chain-of-custody procedures.

5.0 SAMPLE PRESERVATION AND SHIPMENT

Table C-3 presents container and preservation requirements which are followed. All sample containers are precleaned by the contract laboratory. The laboratory also adds the appropriate preservatives, if required. Exposure of samples to excessive heat or sunlight in the field is minimized. The samples are placed in ice chests following collection and are delivered to the laboratory via overnight courier. Prior to analysis, samples are refrigerated at 4° C during laboratory storage.

6.0 ANALYSIS

Samples are analyzed for the parameters listed in Table C-1 plus any additional parameters requested by the off-site disposal facility. The laboratory analytical methods that are used are EPA Methods 3510 and 8270 (SW-846). All methods are EPA approved and are implemented with appropriate quality control. The samples are analyzed within the holding times specified in Table C-3. All organic analysis are performed by an off-site laboratory. CFI has an ongoing contract with Micro-Methods Laboratory located in Ocean Springs, Mississippi. Laboratory QA/QC documentation is included as Exhibit E-1.

7.0 RECORDKEEPING

Persons involved in sample collection and off-site laboratory analysis document the handling history of all samples. The recordkeeping procedure documents sample integrity from the time of sample collection, through analysis, and final disposition.

8.0 SAMPLE LABELS

Sample labels are necessary to prevent misidentification of the samples. The labels are prefixed to the sample containers. The labels are filled out at the time of sample collection. The labels include the following information:

1. Sample Number
2. Name of Collector
3. Date and Time of Collection
4. Place of Collection

An example of labels typically used is included as Exhibit E-2.

9.0 CHAIN-OF-CUSTODY

The sampler completes Chain-of-Custody forms to establish the documentation necessary to trace sample possession from the time of collection to analysis and final disposal. CFI's Chain-of-Custody form is shown as Exhibit E-3.

TABLES

TABLE C-1
HAZARDOUS CONSTITUENTS OF K001 WASTES

Pentachlorophenol
Phenol
2-Chlorophenol
p-chloro-m-cresol
2, 4-dimethylphenyl
2, 4-dinitrophenol
Trichlorophenols
Tetrachlorophenols
Creosote
Chrysene
Napthalane
Fluoranthene
Benzo (b) Fluoranthene
Benzo (a) pyrene
Ideno (1,2,3-cd) pyrene
Benzo (a) anthracene
Dibenzo (a) anthracene
Acenapthalene

Document Title: Quality Assurance Manual Rev 13
Change requested by: DKW / QAO
Change from: Current QAM Format Addressed 2003 NELAC Standards - Old/outdated Organizational Chart in place.

Change to: Format QAM and Address the 2009 TNI Standards using TNI Template - Replace/update Organizational Chart - other changes

Reason for Change: Change required by TNI to maintain TNI/NELAP/ELAP Accreditation

Comments: Rev 13 QAM is currently in revision but remains in effect until formatting changes to meet 2009 Standards are completed

MICRO METHODS LABORATORY

Ethics Policy

It shall be the policy of Micro Methods Laboratory staff to conduct all operations with integrity and in an ethical manner. All Micro Methods Laboratory staff within the limits of their authority and duties is responsible for fostering and enforcement of laws, regulations and other directives, for maintaining the highest standards of ethical conduct, for promoting efficiency and effectiveness in administering of management's programs and activities in all laboratory operations.

1.0 INTRODUCTION

1.1 Purpose

Controlled Document

1.1.1 This document formally defines the quality system requirements for National Environmental Laboratory Accreditation Program (NELAP)/Louisiana Environmental Laboratory Accreditation Program (LELAP) requiring that quality assurance and control procedures shall be delineated in a Quality Manual and followed to ensure and document the quality of the analytical data. The intent of this manual is to establish a system of quality procedures applicable to environmental processes, consistent and compliant with EPA, LELAP and NELAP standards. This Document is based on the standard requirements established in ISO/IEC Guide 25, ISO/IEC 17025, 2003 NELAC Standard, LAC Title 33, and ANSI/ASQC E4-1994 and is compliant with ISO 9001 and ISO 9002. Management and technical staff of Micro-Methods Laboratory Inc. are dedicated to continuous improvement of the analytical and measurement system in place and strive to provide our clientele with credible, useable, defensible data of known quality. For data quality purposes, Micro-Methods accepts and aligns its structure to conform to the standards set forth by these agencies. All Micro-Methods Laboratory sections and employees are subject to the standards published in this Quality Manual. It is the policy of Micro Methods Laboratory that all employees follow the Quality Manual requirements, Standard Operating Procedures, and other associated quality documents. This document and all supporting quality documentation related to quality policies and requirements are available for use by laboratory employees.

1.1.2 This manual and the quality control protocols described in this document are not to be viewed as all inclusive, but rather to serve as a basic foundation on which to continually build a solid quality assurance program within the laboratory. The design and development of the quality system is primarily a function of management, although each employee has the responsibility for acquiring and maintaining knowledge of the quality system operations. In addition, each employee is responsible for following the established quality system procedures and the requirements of the NELAP/LELAP standards.

1.2 Mission Statement

1.2.1 *Micro-Methods is committed to providing our clientele with a quality data product to meet or exceed their data requirements in terms of cost, quality, and delivery. We continually strive to improve in these areas, while maintaining a work environment conducive to ethical work practices.*

Controlled Document

2.0 MANAGEMENT AND ORGANIZATION

2.1 The Quality Organization

2.1.1 Organization

2.1.1.1 The following is a listing of the approved signatories for the laboratory and their job titles:

Harry P. Howell	Owner, Lab Director
Darrell V. Harris	Technical Director /QAO
Barbara Kelly McMillian	Inorganic Supervisor
Tina Tomek	Office Manager

2.2 Physical Facilities, Legal Definition, and Facility Tour Policy

2.2.1 **Legal Definition of the Laboratory--**Micro-Methods Laboratory, Inc. is by definition an "entity that performs analytical testing" and assumes the associated legal liabilities and responsibilities of the analytical operations performed at this facility by Micro Methods Laboratory staff. Micro-Methods was founded in 1972 and is permanently located at 6500 Sunplex Drive, Ocean Springs, Mississippi. The laboratory has over 10,000 square feet of space, with adequate lighting, power, equipment, and resources to perform analytical testing. Micro-Methods employs a competent, experienced staff with adequate supervisory personnel to analyst/technician ratio.

2.2.2 The laboratory has 10,000 square feet of space under roof. The following areas exist within the lab:

1) Extractions Lab
2) Metals Lab
3) Organics Lab
    a. Semi-Volatile Lab
    b. Volatiles Lab
4) Inorganic or Wet Lab
5) Office Area
6) Micro Lab

Controlled Document

2.2.3 Walls and doors separate each area. The Volatiles lab is in a room outside of the main laboratory to minimize contamination to the area. There is adequate hood space for the areas with minimum face velocity at 100ft/min monitored at least annually.

2.2.4 Access is controlled to the Volatiles Lab. Analysts from the Extractions Lab and other Labs are not allowed in the Volatiles Lab if they have been working with solvents or have been in a lab where solvents were used.

2.2.5 Volatiles Lab analysts are not allowed in the Extraction Lab.

2.2.6 Access to the Micro Lab is limited to Wet Lab personnel unless work requires.

2.2.7 Access to the main Sample Storage Cooler is limited to the Sample Custodian and Lab Management.

2.2.8 It is the policy of Micro Methods Laboratory that all tour groups or individuals must be accompanied at all times by at least one Micro Methods staff person. All visitors are required to wear safety glasses in the laboratory area, but no safety glasses are required in the office and break areas. Visitors must follow all safety rules and regulations pertaining to the laboratory. Tour requests must be scheduled through the Office Manager and approved by the Lab Director.

2.3 Resource Allocations for QA/QC Laboratory Operations

2.3.1 Management has incorporated the cost of quality control into the cost of the analyses. In most cases, the burden of the cost for quality control is shared between the client and the laboratory. Adequate resources and trained personnel are provided to carry out the quality procedures and all laboratory operations. A staff comprised of members independent of those involved in the actual testing shall perform system audits.

2.4 Management of the Quality Control Program and Laboratory

2.4.1 Management of the laboratory is the responsibility of senior management officials, the President and the Vice-President. Their ultimate authority extends to all aspects of the organization and has final decision-making power at all levels. Their duties include, but are not limited to:

1) Ensure that quality management is an identified activity with adequate resources to accomplish its program quality goals.
2) Ensure that all laboratory components and programs comply fully with the quality system.
3) Perform all quality management roles and responsibilities assigned to them in their organization or area.
4) Assume a primary contact role with clients.

Controlled Document

5) Maintain good client-laboratory relations with clients.
6) Provide work environment conducive to good work ethics, free from any undue pressures, which might adversely affect the quality of work or technical judgment.
7) Provide motivation and incentives to promote good data output.
8) Define the minimal level of qualification, experience, and skills necessary for all positions in the laboratory.
9) Ensure that a quality data product is produced.
10) All analytical operations and testing shall be performed to the extent possible in such a manner as to meet the requirements of the NELAC/LELAC Standards.
11) Shall be impartial

2.4.2 Management of the Quality Assurance Program as described in this manual requires the services of the Quality Assurance Officer AO within the laboratory to carry out the monitoring, record-keeping, statistical techniques, calibration scheduling, and other functions required by the system. The QAO is not actively involved in the analytical testing, but is responsible for data review with respect to quality and compilation of QC data and reporting to Management. The AO acts as an intermediary between Technical Staff and Management with respect to quality. In the event that the QAO is unable to perform his/her duties for short periods of time, the Organics Lab Supervisor and the Inorganic Lab Supervisor shall act as designees with their sections to perform the duties of the QAO until such time as the QAO is able to resume his/her duties. If the QAO is unable is absent for 90 days or greater, Kallie Lunsford will assume duties of QAO.

2.5 Quality Organizational Chart

2.5.1 The Organizational Chart of Micro-Methods illustrates the chain of command. (See Figure 1. below).

Controlled Document

Micro-Methods Laboratory Organization Chart

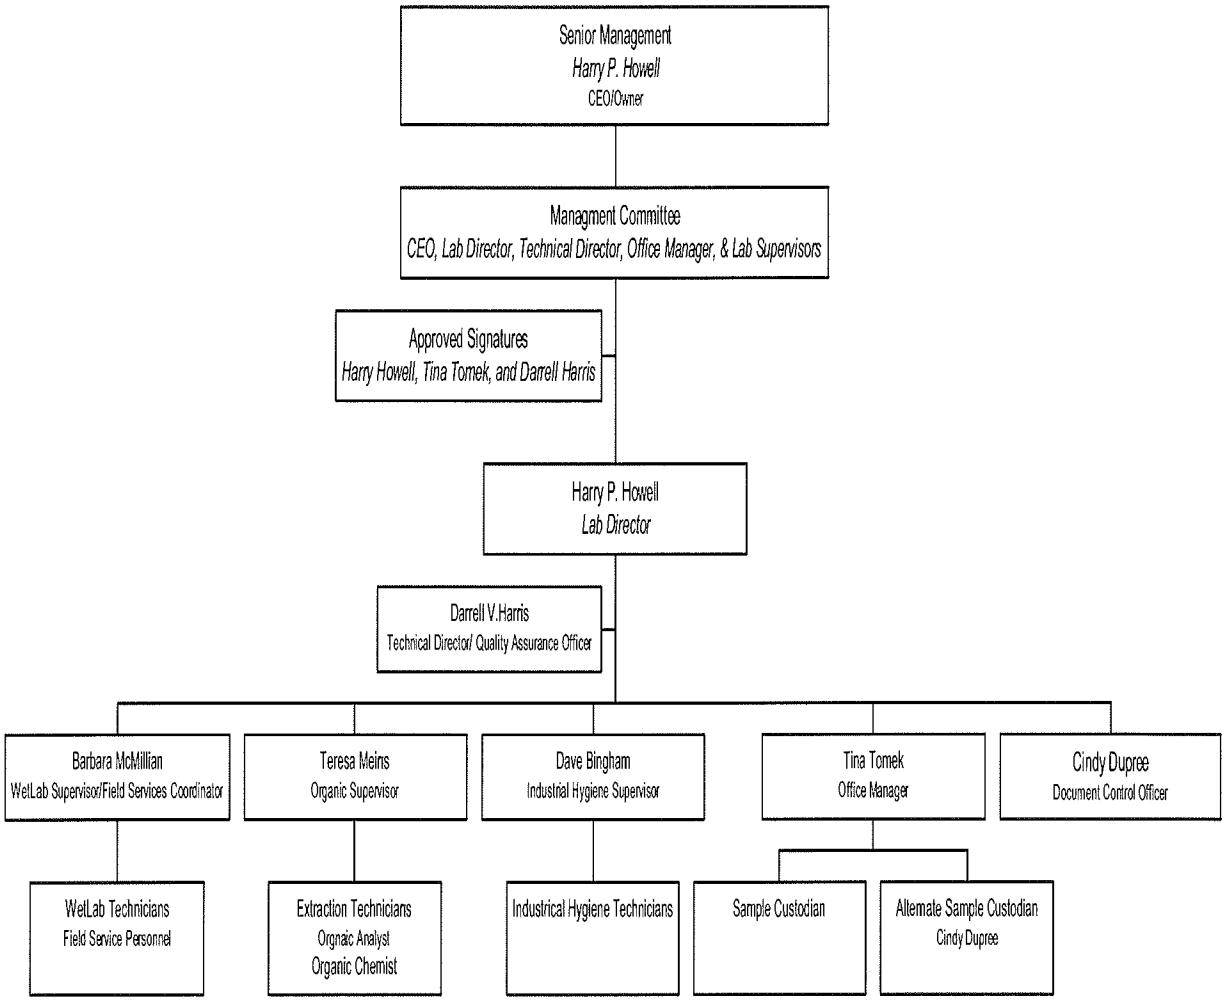

Figure 1 Micro-Methods Laboratory Organization Chart

Controlled Document

2.5.2 The QAO has direct access to the highest level of Management at which decisions are taken on laboratory policy or resources, with access to Lab Director and the technical staff. The lines of communication follow the directives in normal chain of command protocol. Communication can flow upward and downward. Open lines of communication are necessary for the input into all phases of planning, implementing, and assessing the environmental programs to which the quality system is applied. Accountability and authority is equal at each level and follows the regular chain of command protocol.

2.6 Quality AssuranceOfficer Responsibilities and Authority

2.6.1 The QAO is responsible for the Quality Assurance Program within the organization.

2.6.2 The QAO shall recommend measures to ensure fulfillment of the quality objectives and policies established in conjunction with Management, in an expedient, effective manner.

2.6.3 The QAO shall set quality guidelines based on method requirements or laboratory requirements, whichever is more stringent or creates a more defensible data package.

2.6.4 The QAO develops and carries out quality control programs, advises, and assists technical staff in implementing, staffing, and supervising these programs.

2.6.5 The QAO reviews new technology, methods, equipment, and advises management as to such use with respect to quality.

2.6.6 The QAO coordinates schedules for measurement systems, functional checks, calibrations, and other checking procedures based on method requirements and instrument manufacturer requirements.

2.6.7 The QAO develops the system used to control sample measurement; advises technical staff in selection of suitable samples and prepares samples as delegated by Management for internal performance evaluations.

2.6.8 The QAO evaluates data quality, maintains reports, control charts, calibration records, and other pertinent performance records.

2.6.9 The QAO coordinates and conducts quality problem investigations and reports to Management.

Controlled Document

2.6.10 The QAO advises and trains staff in matters of quality assurance.

2.6.11 The QAO reviews work proposals for quality assurance aspects.

2.6.12 The QAO serves as the Micro-Methods quality assurance representative for mandated QA/QC programs.

2.6.13 The QAO serves as the primary contact for external source audits.

2.6.14 The QAO is responsible for writing, editing, and maintaining the Quality Assurance Manual for the laboratory. The QAO shall review the QAM at least annually, revise, approve by signature on the Title Page of the QAM, and issue the revision.

2.6.15 The QAO shall maintain a list of approved signatories responsible for signing or authorizing any laboratory record.

2.6.16 The QAO is responsible for ensuring that the Quality System is implemented and followed at all times.

2.6.17 The QAO shall serve as the focal point for QA/QC activities and shall be responsible for the oversight and/or review of quality control data.

2.6.18 The QAO (and/or his/her designees) have functions independent from laboratory operations for which they have quality assurance oversight.

2.6.19 The QAO shall be able to evaluate data objectively and perform assessments without outside (e.g., managerial) influence.

2.6.20 The QAO shall be knowledgeable in the quality system as defined under NELAC and LAC requirements, as well as any other accrediting, certification program, or standards requirements (e.g. ISO/DIS 17025).

2.6.21 The QAO shall immediately notify the Lab Director when deficiencies in the Quality System are found (following audits).

Controlled Document

2.7 Ethics and Compliance Officer Duties and Responsibilities

2.7.1 It is the responsibility of the Ethics and Compliance Officer (ECO) and the Management Committee to establish policies and procedures that are conducive to creating an ethical work culture for all laboratory operations.

2.7.2 The ECO is responsible for writing and implementing standard operating procedures related to ethical laboratory operations and procedures concerning data integrity.

2.7.3 The ECO is the laboratory point of contact for ethical issues from both internal and external sources.

2.7.4 It is the responsibility of the ECO supported by the Management Committee to initially train laboratory staff within the first month of employment and annually thereafter on content, meaning, interpretation, and application of the Ethics Policy and Data Integrity Policy.

2.7.5 It is the responsibility of the ECO to initiate and maintain Ethics and Data Integrity Training Documentation in the employees Quality Training files.

2.7.6 It is the responsibility to store and maintain the documentation for a minimum of 10 years.

2.8 Lab Director/Technical Director Duties and Responsibilities

2.8.1 The Technical Staff is under the supervision of a Laboratory Director who has overall responsibility for the technical operations of the laboratory. The Laboratory Director shall oversee all the daily operations of the laboratory, review all final reports, accept reports and recommendations from the QAO, establish client relations, represent the laboratory in business and legal matters, establish guidelines for efficient operation and advise in all business and technical matters, understand limitations on the measurements and discuss them with clients as appropriate.

2.8.2 The Laboratory Director and Technical Director/QAO provide limits of uncertainty of all data reported, including that due to sample and to measurement supported by statistical inference and professional judgment as pertinent; state clearly the bias for any interpretations provided of the data.

2.8.3 In the event that the Laboratory Director is unable to perform his/her duties, the Technical Director/QAO shall assume the overall responsibility for the technical operations of the laboratory and the office manager shall assume the overall responsibility for the business operations.

2.8.4 In the event that the Technical Director/QAO is unable to perform his/her duties for a period greater than 65 days, the Laboratory Director will assume the duties of Technical Director and Ethics Control Officer, Kallie Lunsford will assume QAO

Controlled Document

responsibilities, and Dave Bingham will assume LIMS/IT administrative responsibilities.

2.9 Lab Supervisors and Technical Staff Duties and Responsibilities

2.9.1 Inorganic Lab Supervisors report to the Lab Director. Organic Lab Supervisor reports to the Technical Director.

2.9.2 Responsible for day-to-day operation of the lab section they oversee.

2.9.3 Responsible for producing valid, accurate data from the raw data gathered from the analyses.

2.9.4 Shall guide, direct, and train each employee under his/her supervision.

2.9.5 Shall act as an intermediary between employees and the Lab Director and Technical Director. Shall maintain a professional working relationship with those under his/her supervision.

2.9.6 Shall verify methods; write SOPs, set up new instruments and computers, check all raw data for errors, review and authorized data for final reporting.

2.9.7 Shall direct the QA/QC program in the temporary absence of the QAO. A temporary absence is defined as less than a 90 day period.

2.9.8 Shall supervise no more than ten analysts and or technicians in order to ensure an optimum supervisor to analyst ratio.

2.10 Analysts/Chemists and Analysts/Technicians Duties and Responsibilities

2.10.1 Report directly and under the supervision of the Lab Supervisors of the area to which they are assigned.

2.10.2 Acquire full understanding and develop technical competence in every area of the position or job.

2.10.3 Comprehend, to the extent possible, all problems for which analytical services are required. Ascertain the validity of the method selected. Understand limitations on the measurements.

2.10.4 Use validated methods or written procedures exclusively.

2.10.5 Demonstrate statistical control of the analytical system before measurements are made.

Controlled Document

2.10.6 Calibrate according to method requirements and engage in inter-calibration activities as appropriate to minimize internal laboratory bias.
2.10.7 Utilize documented procedures and record all significant experimental details in such a way that a competent analyst could reproduce the measurements at a later date.
2.10.8 Utilize recognized Good Laboratory Practices and Good Measurement Practices throughout all aspects of sampling and measurement processes.
2.10.9 Provide limits of uncertainty of all data reported, including that due to sample and to measurement supported by statistical inference.
2.10.10 Confirm the qualitative identification of parameters measured and provide supporting evidence.
2.10.11 Retain all sample data, and documentary evidence for a minimum of 10 years.

Controlled Document

2.11 Reporting Relationship of QAO and Management

2.11.1 The QAO shall report directly to Management in all matters concerning data quality or quality performance, including problems related to routine quality matters.

2.11.2 All technical management staff shall receive copies of written reports (internal or external audits, changes to SOPs, or any change affecting quality of data or lab procedures) generated by the QAO. Management shall make recommendations based on input from the Laboratory Director, QAO and technical staff.

2.11.3 The QAO position is an independent job entity solely under the direction of Management with reporting lines directly to all sections of the lab. The QAO is independent of the analytical testing, separate from the lab sections that generate, compile and evaluate the data for release, but is responsible for data review for quality purposes and assessments of performance as required by the analytical methods and the quality system. It is the responsibility of the technical staff beginning with the supervisors and Lab Director to implement and continue the quality procedures at the lower levels. It is the responsibility of Management to implement and continue the quality policies at the upper levels. The QAO shall aid in making recommendations to each level regarding quality issues.

2.12 Understanding, Communicating, and Implementing the Quality System

2.12.1 Management shall form a project team, made up of the, the Chief Executive Officer, Office Manager, Laboratory Director, and the Technical Director/AO, called the Management Committee, whose function is to initially establish goals, objectives and groundwork for the quality system. They shall formulate a plan to schedule quality policy implementation.

2.12.2 After the Quality System policies and mission have been established, an operational team, comprised of the Technical Director/QAO, the Lab Director, the Inorganic Lab Supervisor and the Organic Lab Supervisor, shall begin implementation of the plan and shall monitor the performance of the Quality System through internal system audits.

2.12.3 All employees whose tasks affect the quality of data shall receive training for the specifics of the Quality System, which shall include and require reading the Quality Assurance Manual and shall document this activity using the Quality Documents Read form maintained in their personal QC Training file.

Controlled Document

2.12.4 Once the Quality System is operational, it is the responsibility of all employees to accept and follow its precepts, to provide feedback, to improve the quality system, and the quality of data.

2.13 Change of Ownership and/or Location of Micro Methods Laboratory

2.13.1 In order to ensure that clients' records shall be maintained in the event of changes in ownership, bankruptcy, out of business, or location of Micro Methods Laboratory the following guides shall be followed:

2.13.1.1.1 Changes in ownership or location shall be reported to all accrediting and regulating bodies. Clients shall be notified by mail or phone if the change affects the working relationship. The previous owner must agree in writing before ownership transfer to be accountable and liable for all analyses, data and reports generated up to the time of legal transfer of ownership occurs. The buyer must agree to be responsible for maintenance of the records after the ownership transfer.

2.13.1.1.2 The buyer must agree in writing to be accountable and liable for all analyses, data and reports generated after the legal transfer of ownership occurs. All records pertaining to accreditation are kept for a minimum of 10 years, subject to inspection by accrediting or regulating bodies.

2.13.2 In the event of bankruptcy, appropriate regulatory and state legal requirements concerning laboratory records shall be followed.

2.14 Laboratory Security Policy

2.14.1 This policy establishes the security requirements for this facility to ensure that confidential information, technologies, and lab operations are not compromised and that analytical services and other interests are protected from internal and external activities.

2.14.2 The following laboratory security measures are employed:

1) Doors between the main offices and the laboratory are closed and have signs posted restricting the entrance to employees and authorized persons only.
2) Outside exit doors are closed, locked or monitored at all times.
3) All employees are aware of the requirement to question and determine legitimacy of the presence of any stranger in the laboratory.

Controlled Document

4) Staff personnel must escort all deliveries through the laboratory.
5) Clients dropping off samples in the sample receiving area, then needing access to the main offices must be escorted through the laboratory.
6) The laboratory is equipped with motion, sensitive, heat sensitive, and glass breaking sensitive detectors.
7) The sample custodian locks the main sample storage area at the end of each workday unless after hours work is required. Then it is the responsibility of the supervisor or designee to lock the storage area.
8) All doors are locked and checked by the last person in the building.
9) The alarm system is armed by the last person in the building and disarmed by the first person in the building. Alarm codes and passwords are required.
10) Only authorized staff is allowed to have building keys.

2.14.3 The Lab Director, Office Manager, Lab Supervisors and the QAO are responsible for controlling lab access. Access to any lab section will only be granted by the Lab Director or one of the designees listed above. Access will only be granted to individuals with an immediate business need within the lab, either short-term or as defined by their ongoing job function. The Lab supervisors are responsible for monitoring the "Visitor List" to ensure that those who no longer require access to the laboratory have their access terminated.

3.0 QUALITY SYSTEM AND DESCRIPTION

3.1 Purpose of the Quality System

3.1.1 The purpose and intent of this document is to establish and formalize operational policies and procedures for all laboratory activities. This defined quality system is essential for insuring that the data products generated from the analytical processes are well defined, defensible, and useable.

3.1.2 The provisions of quality analytical services to our customers have earned Micro-Methods a solid reputation. Maintaining this status in providing quality services to our customers is the responsibility of every member of the laboratory staff. In order to accomplish this, the management of Micro-Methods has implemented a management system to document how this laboratory shall plan, implement, and access the effectiveness of quality assurance and quality control operations applied to the analytical procedures in use. The result of quality management is called the quality system. The Quality Assurance Manual is structured following the standards

Controlled Document

of ISO/DIS 17025 *General Requirements for the Competence of Testing and Calibration Laboratories*, consistent with requirements mandated by NELAC Chapter 5, LAC *Title 33,* and requirements defined by EPA for Quality Assurance Project Plans in EPA Requirements for Quality Assurance Project Plans (QA/R-5) (EPA 2001). Supporting documentation consists of Standard Operating Procedures and other Quality Related Documents and records that require document control.

3.2 Data Quality Objectives (DQO).

3.2.1 The Management Committee shall review DQO annually to determine their effectiveness to the Laboratory Quality System. Objectives shall be modified, added, or deleted to accomplish the changes to the system. The systematic approach outlined in the EPA document "Guidance for the DQO Process EPA QA/G-4" shall be adapted to aid in determining the changes to DQO. DQOs provide statements about the expectations and requirements of the data user (clients). DQOs are necessary to making decisions in the planning stages and shall be used as the basis for these decisions to the Laboratory's Quality System, as well as to specific project plans. The following lists the steps taken to establish DQOs:

1) State the problem
2) Identify the decision
3) Identify the inputs to the decision
4) Define the boundaries of the study
5) Develop a decision rule
6) Specify tolerable limits on decision errors
7) Optimize the design for obtaining data
8) Development of the DQOs is the joint responsibility of the Laboratory Director, QAO, technical staff and laboratory staff.

3.3 Quality Assurance Project Plans (QAPPs).

3.3.1 QAPP are the means of implementation of the requirements established by the DQOs. The QAPP translates the requirements into measurement performance specifications and QA/QC procedures for the laboratory to satisfy the data needs of the client. The supporting documentation completes the planning stage of the quality system. The routine planning and implementation of the laboratory quality system is documented in the Quality Assurance Manual. Other project specific plans shall be developed as required. The Laboratory shall use the EPA document, "EPA Guidance for Quality Assurance Project Plans, EPA QA/G-5" as the guide to establishing

Controlled Document

specific project plans. The Lab Director and QAO shall be responsible for writing, editing, and maintaining any specific Quality Assurance Project Plan.

3.4 Standard Operating Procedures (SOPs).

3.4.1 Refer to SOP ***Procedure for the Preparation, Review, and Approval for Standard Operating Procedures DCN 3015*** for detailed information related to Standard Operating Procedure initiation, use, and maintenance.

3.4.2 SOPs document routine or repetitive administrative and technical activities, which aid in creating consistency in the quality and integrity of the data output, promoting quality through consistency. SOP development for technical and administrative activities is an essential component of the quality system. The laboratory shall maintain SOPs that accurately reflect all phases of current laboratory activities. Individuals knowledgeable shall write SOPs for laboratory operations, use of the equipment, and the procedures related to the internal structure of the organization. SOPs must be detailed so that technicians with limited experience could reproduce the procedure or activity. The SOPs are validated by the Laboratory Director, or designee, and by the QAO. The Lab Supervisors, Lab Director and/or QAO review SOPs at a minimum of annually or whenever methods or procedures change. Current copies of all SOPs are available for use. A master list of all SOPs and Forms is maintained. The Document Control Officer (DCO) shall be responsible for maintaining the master list and file of all quality related SOPs.

3.4.3 The Lab Director is responsible for the overall SOP operation and reviews all SOPs or designates a Lab Supervisor to review the SOPs related to their area of expertise.

3.4.3.1 It is the responsibility of the Document Control Officer (DCO) to provide SOP Document Control Numbers (DCN) as new SOPs are written.
3.4.3.2 It is the responsibility of the DCO to maintain and track all original SOPs as controlled documents.
3.4.3.3 The Laboratory Supervisors for each Lab section are responsible for all technical SOPs in their areas.
3.4.3.4 Analysts, under the direction of the Lab Supervisor or Lab Director, may be assigned to prepare or revise technical SOPs.
3.4.3.5 The Lab Director and QAO must approve all SOPs before being suitable for use and implemented for work.
3.4.3.6 The DCO shall be responsible for archival and maintenance of all outdated original SOPs.

Controlled Document

3.4.4 SOP PREPARATION

3.4.4.1 All activities related to the quality of the data product shall be addressed in the form of an SOP.

3.4.4.2 The laboratory shall address in clearly defined, written SOPs or equivalent, at a minimum the following:

3.4.4.2.1 methods of analysis
3.4.4.2.2 procurement and inventory procedures
3.4.4.2.3 preventive maintenance
3.4.4.2.4 record-keeping and record storage (archives)
3.4.4.2.5 data reduction, validation, and reporting
3.4.4.2.6 correcting erroneous reports
3.4.4.2.7 management of laboratory wastes and hazardous materials
3.4.4.2.8 complaints
3.4.4.2.9 deterrence of fraud, ethics policy
3.4.4.2.10 standards preparation
3.4.4.2.11 support instrumentation calibration and checks
3.4.4.2.12 standard operating procedures
3.4.4.2.13 quality control/quality assurance
3.4.4.2.14 data validation and reporting

3.4.4.3 SOPs must be written in a concise, step-by-step, easy to read format. The information shall not be overly complicated, using the active voice and present verb tense. The document shall not be wordy, redundant or overly lengthy.

3.4.4.4 SOPs must be written with sufficient detail such that someone with limited experience or knowledge of the procedure, but having a basic understanding, can successfully reproduce the procedure without supervision.

3.4.5 SOP REVISIONS

3.4.5.1 When changes to an SOP are necessary, the assigned person shall draft modifications using the most current revision of the existing SOP file.

3.4.5.2 The assigned person shall save the current file as a new file incrementing the revision number by 1.

3.4.5.3 The assigned person shall make the necessary changes and save them to file, print out the SOP for review and approval. The supervisor, lab director, or QAO may request further revisions, requiring that the previous step be

Controlled Document

repeated. Once an acceptable SOP is submitted, the SOP preparer and the supervisor or lab director shall sign the SOP and submit it to the QAO for approval.

3.4.6 SOP REVIEW and APPROVAL

3.4.6.1 Each existing SOP shall be reviewed at least annually form the date of the last approval. The SOP shall be re-approved if no changes are warranted. The documentation of this process shall be a new signature page with signatures appropriate for the type SOP. Any change to the SOP's major procedures or QC limits shall be documented in a revision to the SOP and submitted for approval. Errata pages can be attached where needed until the next update. Each data package of sample results shall be referenced to the Method of analysis or the SOP used to generate the results, including SOP# date and revision#.

3.4.6.2 All modifications made to an approved SOP must first be reviewed and approved by the Lab Supervisor or Lab Director and QAO before being issued for use. Data must be presented to ensure that the modification does not adversely affect the accuracy and precision of the previously approved SOP when the SOP revision relates to major procedure changes. All original SOPs shall be kept on file by the QAO. The QAO shall track the use of each modification and report to management, including recommendations to formally revise the SOP permanently, if the validation data of the modified SOP indicates it is prudent to do so.

3.4.7 SOP TRACKING

3.4.7.1 It is the responsibility of the QAO to track Quality related SOPs for purposes of determining a review schedule for all active Quality related SOPs and to record the dates of the last approval and archival of older, outdated versions.

3.4.7.2 It is the responsibility of the Lab Supervisors or designees to track all Technical related SOPs for the purpose of review and update.

3.4.7.3 All SOPs are reviewed during the month of January or February when possible, with changes completed by March.

3.4.7.4 The tracking system is performed in the excel File DCN. All revisions are numbered with a Document Control Number. Revisions are tracked in the header of the SOP and on the file name containing the SOP. All SOPs are

Controlled Document

kept in the folder "Standard Operating Procedures in the QAO "My Documents". SOPs shall be stored on CD for future review.

3.4.7.5 Distribution of SOPs and other associated documents shall be performed by the QAO. The SOPs shall be distributed to the affected party (Lab Supervisors, Lab Director, Office Manager, QAO, and lead analysts when necessary).

3.4.7.6 Retired SOPs, SOPs no longer in routine use, or revised SOPs shall be kept with the current version. A divider stating OUTDATED VERSION shall separate the current SOP from all other SOPs.

3.4.7.7 Each technical SOP shall be placed near where the analysis is performed.

3.4.7.8 Administrative SOPs are maintained in manual form.

3.4.7.9 All technicians are required to read, understand, and follow the most current SOP for the work that is assigned to them.

3.4.8 TECHNICAL SOP FORMAL

3.4.8.1 The SOP format shall generally follow EPA QA/G-6 March 2001, Section 7.0 Some of the sections were merged and or added from the suggested to format to comply with NELAP/LELAP requirements. In these instances, the information is checked to ensure the information required for the SOP is addressed. The format is listed below.

3.4.8.2 Each SOP and its computer file contain header and footer information. The document is paginated with a header similar to the one on this page. Some appendices may not be included in the page numbers if they are copies of documents.

3.4.8.3 SOPs are maintained in Word Format.

3.4.9 ADMINISTRATIVE SOP FORMAT

3.4.9.1 As with technical SOPs, administrative SOPs can be written for a wide variety of activities, such as reviewing documentation and contracts, QA Project Plans, Quality Management Plans, Quality Assurance Manuals, auditing, training, data validation, and describing office operations.

Controlled Document

3.4.9.2 Administrative SOPs should include specific steps aimed at initiating the activity, coordinating the activity, and recording and/or reporting the results of the activity. For example, audit or assessment SOPs should specify the authority for the assessment, how person(s) being audited are to be selected, what shall be done with the results, and who is responsible for the corrective action. Administrative SOPs should fit within the framework presented next but the format can be modified, reduced, or expanded as needed.

3.4.9.3 The Administrative SOP shall consist of a Title Page with approval Signatures, Table of Contents, Procedures, Quality Assurance/Quality Control, and References. Tables, Checklists and Flow charts may be added where needed.

3.4.9.4 Procedures shall capture the following information where applicable:
- 3.4.9.4.1 Purpose
- 3.4.9.4.2 Scope and Applicability
- 3.4.9.4.3 Summary
- 3.4.9.4.4 Definitions
- 3.4.9.4.5 Personnel Qualifications/Responsibilities
- 3.4.9.4.6 Procedure
- 3.4.9.4.7 Criteria, Checklists, and Standards
- 3.4.9.4.8 Data and Records Management
- 3.4.9.4.9 Quality Control and Quality Assurance Section.

3.5 Data Quality Assessments

1) Data shall be continually assessed and evaluated through internal quality checks.
2) Data shall be monitored for the following: accuracy, precision, completeness, comparability, representative ness, and statistical confidence.
3) The routine data along with the QC/Performance Evaluation data shall go through data validation verification, which measurement performance and measurement procedures are validated and verified. The data is reviewed for reporting requirements.
4) The validated/verified data is further assessed using the five-step process of the EPA document "Guidance for Data Quality Assessment" EPA QA/G-9: Review the DQOs and sampling design; conduct a preliminary data review; select the statistical test; verify the assumptions of the statistical test; and draw conclusions from the data.

Controlled Document

3.6 Identification of Activities to which QA/QC is applied

3.6.1 The Quality Assurance/Quality Control policies shall be applied to, but are not limited to the following activities:

1) Management Activities
2) Personnel Training
3) Procurement of Supplies
4) Documentation and Records
5) Computer Hardware and Software
6) Project Planning
7) Laboratory and Field Operations
8) Data Acquisition
9) Data Reduction, Review, and Validation
10) Systems Maintenance and Calibration
11) Assessment and Response
12) Quality Improvement

3.7 Quality Assurance Manual

3.7.1 The Quality Assurance Manual (QAM) states the policies and operational procedures established by Micro-Methods to meet and carry out the guides established in the Quality System. The QAM and related documentation shall address and contain the following:

3.7.2 The QAM shall list on the title page:

1) Document title
2) The laboratory's full name and address
3) The name and telephone number of the laboratory, where individuals responsible for the laboratory can be reached
4) The name of the QAO
5) The identification of all major organizational units which are to be covered by the quality system and the effective date of the version

3.7.3 The QAM and associated documentation also contains the following:

1) A quality policy statement, including objectives and commitments by top management
2) The organization and management structure of the laboratory, its place in any parent organization and relevant organizational charts

Controlled Document

3) The relationship between management, technical operations, support services, and the quality system
4) Procedures to ensure that all records required under this quality system are retained, as well as procedures for control and maintenance of documentation through a document control system, which ensures that all SOPs, manuals or documents clearly indicate the time period during which the procedure or document was in force
5) Job descriptions of key staff and reference to the job descriptions of other staff
6) Identification of the laboratory's approved signatories; at a minimum, the title page of the Quality Manual must have the signed concurrence, (with appropriate titles) of all responsible parties including the QAO, the Laboratory Director, Office Manager, and Laboratory Supervisors
7) The laboratory's procedures for achieving trace ability of measurements
8) A list of all test methods the laboratory performs
9) Mechanisms for ensuring that the laboratory reviews all new work to ensure that it has the appropriate facilities and resources before commencing such work
10) Reference to the calibration and verification of test procedures
11) Procedures for handling submitted samples
12) Reference to the major equipment and reference measurement standards, as well as the facilities and services used by the laboratory in conducting tests
13) Reference to procedures for calibration, verification, and maintenance of equipment
14) Reference to verification practices including inter-laboratory comparisons, proficiency testing programs, and use of reference
15) Procedures to be followed for feedback and corrective action whenever testing discrepancies are detected, or departures from documented policies and procedures occur
16) The laboratory management arrangements for exceptionally permitting departures from documented policies and procedures or from standard specifications
17) Procedures for dealing with complaints
18) Procedures for protecting confidentiality, security concerns, and proprietary rights
19) Procedures for audits and data review
20) Processes/procedures for establishing that personnel are adequately experienced in the duties they are expected to carry out and receive any needed training
21) Reference to procedures for reporting analytical results and a Table of Contents, applicable lists of references, glossaries, and appendices

Controlled Document

4.0 STATEMENT OF QUALITY POLICIES

4.1 Policy on Ethics and Fraud in the Laboratory

Refer to SOP *Guidelines for Analytical Decision Making and Ensuring and Assessing Data Integrity DCN: 3011.*

It is the responsibility of the Lab Director supported by the Ethics and Compliance Officer to inform employees of their responsibilities concerning Fraud, Waste, and Abuse regulations. All Micro Methods employees within the limits of their authority and duties are responsible for fostering and enforcement of laws, regulations, and other directives, for maintaining high standards of ethical conduct, and for promoting efficiency and effectiveness in the administration of management's programs and activities.

These responsibilities require that all Micro Methods employees promptly report instances of and any information on any known or suspected violation of law, rules, or regulations, mismanagement, gross waste of funds or resources, abuse of authority, or any situation which may adversely affect data quality or integrity, or substantial and specific danger to the public health and safety. Employees shall report such activities to the Ethics and Compliance Officer or may elect to anonymously place a note describing the incident into the complaint box located in the laboratory break room.

Action shall not be taken or threatened against any employee as a reprisal for making complaints or disclosing any information to Management unless the complaint was made or the information disclosed with the knowledge that it was false or with willful disregard for its truth or falsity.

The identity of an employee, other than a supervisor or a manager acting in his or her official capacity, who comes forth with a complaint or information by contacting management, shall be kept confidential to the extent possible. Exceptions can be made to this general rule when the employee consents in writing to the release of his/her name.

The accountability for negligence or falsification of data shall rest upon the analyst, management and Micro Methods.

Under no circumstances shall a Micro Methods' employee report false data, misrepresent any data, or manipulate data to give false credibility to the data.

Controlled Document

If an employee has knowledge of, or suspects that a co-worker has committed a fraudulent act, it is his/her responsibility to report the activity in full to the Ethics and Compliance Officer (ECO) or the Lab Director.

Any reported or suspected infractions of data integrity or unethical behavior affecting data integrity, company reputation, or client relationships shall result in a detailed investigation initiated by the Ethics and Compliance Officer that could possibly lead to serious consequences that may include immediate termination, debarment, or civil and or criminal prosecution.

In the event that the investigation focus is on a Management function or activity or an activity of the ECO, in which Management or ECO participation biases the investigation, Management or the ECO shall remove itself from the investigation and be replaced with suitable and agreed upon investigator/s.

The procedures on ethics and data integrity shall be reviewed by the ECO/QAO at least annually with concurrent approval for use by the Lab Director.

All documentation of the investigation and outcome, including discipline shall be placed in the employee's personnel file and maintained for a minimum of 7 years.

4.2 Code of Ethics

All Micro Methods employees are charged with the following:

- Providing accountability for the quality and integrity of the analytical services they provide. Proper documentation of pertinent laboratory functions and the resulting data product to ensure that the data product is of known and documented quality is the responsibility of all employees.
- It is the responsibility of all employees to strive to maintain and improve their technical knowledge and professional competence. This responsibility requires that each employee become competent in the use of the tools and data interpretation necessary for the performance of their assigned tasks and duties.
- Each employee is responsible for maintaining cooperative, professional working relationships with clients and their co-workers.
- Shall engage only in those activities that do not endanger the trust in its independence of judgment and integrity in relation to its environmental testing activities.

Controlled Document

4.3 Statement of Laboratory Quality Policy

4.3.1 Micro-Methods' goal is to earn the recognition as an industry leader in environmental and analytical testing services. The following quality policy statement has been issued by the Lab Director and Chief Executive Officer:

4.3.1.1 **We, at Micro-Methods shall achieve this status by providing our clients with credible, defensible data, and data of known and documented quality through a total commitment to our quality system and supporting procedures.**

4.3.2 Because of the decisions made from analytical data, as well as the possibility of litigation, it is necessary that data be supported by controls to assure the data user and the data generator that the results are acceptable for the use intended.

Controlled Document

4.4 Quality Goals

4.4.1 Micro-Methods is committed to good laboratory practices and providing quality analytical services to all of our clients. We shall accomplish this by establishing the following quality goals:

1) Implement a quality management system that shall achieve and monitor data integrity, validity, and usability.

2) Establish and maintain a comprehensive training program quality and analytical training for all employees engaged in decisions affecting the quality of laboratory output.

3) Establish and maintain a system to ensure that analytical measurement systems are maintained in an acceptable status of accuracy, stability, and reproducibility.

4) Establish and maintain a system of problem detection through quality control indicators.

5) Use exclusively published and written procedures for operation.

6) Document all aspects of the measurement process in order to provide data that is technically sound and legally defensible.

7) Establish and maintain laboratory assessment and audit procedures for all analytical and document control systems.

8) Establish and maintain policies and procedures to ensure the client's confidential information and proprietary rights.

4.5 Quality Objectives

4.5.1 Goal of the Laboratory Quality Assurance Program is to assure that the measurement program of Micro Methods provides high-quality research and analytical measurement data, which are accurate, reliable, and adequate for the intended purpose in a cost effective manner. To this end, Management is dedicated to the encouragement of excellence in measurement and to provide the physical and mental

Controlled Document

environment conducive to its achievement. To further these objectives, the quality assurance program described in the following sections has been established and applies to all scientific and technical work conducted, in principle and in detail, to the extent possible and feasible.

4.5.2 QA/QC protocols are derived from EPA SW-846 Methods, Methods of Chemical Analysis of Water and Waste Water, EPA-600 series Methods, EPA-500 series Methods. The following documentation shall outline the measures used in the Laboratory to achieve the measurement program goal.

4.5.3 Specific quality objectives are located in the Appendix to this document.

4.6 Operations Policy

4.6.1 It is the policy of Micro Methods Laboratory staff to conduct all laboratory operations within the framework of the following four guiding principles:

1) Safety
2) Integrity
3) Quality
4) Service

All of these principles must be present for successful laboratory operations.

4.6.1.1 Safety Policy

The primary consideration in all laboratory operations must be safety focused. Safety must never be compromised and takes priority over all considerations during the testing. It is the responsibility of all staff to have a clear understanding of basic laboratory safety rules and must be able to safely perform laboratory activities within their area of responsibility. Each employee must maintain a constant vigilance over safe operations and to notify their supervisor, lab director, or safety officer of unsafe conditions. If unsure of the safety of any procedure, method, or operational activity, it is the responsibility of each individual to contact his or her immediate supervisor, the lab director, or safety officer. Analysts and technicians must never initiate an action, procedure, or method if uncertain of how to safely proceed.

4.6.1.2 Data Integrity and Laboratory Ethics Policy

It shall be the policy of Micro Methods Laboratory staff to conduct all laboratory operations with integrity and in an ethical manner. All Micro Methods Laboratory staff within the limits of their authority and duties is

Controlled Document

responsible for fostering and enforcement of laws, regulations and other directives, for maintaining the highest standard of ethical conduct, and for promoting efficiency and effectiveness in the administration of management's programs and activities in all laboratory operations.

This policy extends to and includes all aspects of data production, analysis, review, reporting, communication of data, advertisement, field services, management, accounting and outsourcing. This policy is, in effect, the cornerstone and foundation of the laboratory's self governance program, having as its purpose and intent the "commitment of the entire laboratory staff to comply with all applicable laws, regulations, and policies, and to adhere to the highest professional standards of business ethics and honesty." Management is committed at all levels to adhere to the program.

It is essential that every employee of Micro Methods Laboratory understands and upholds these ethical work standards and practices in order to preserve the basic integrity of all laboratory operations affecting the data product. Without full cooperation from the entire staff, the achievement of full conformance with the policy goals is compromised and consequently threatens the survival of the laboratory. Additionally, ethical performance and data integrity must supersede all other operational laboratory objectives.

Data integrity can be defined in simplistic language as data in "the state of being unimpaired", and performed according to appropriate and approved for use practices and procedures. Data integrity is made defensible through complete and accurate documentation of all laboratory operations and activities affecting the quality of the data. Included among these items are: strict chain of custody procedures and sample security; clear and precise documentation of the laboratory activities performed during the collection, preparation, and analysis of the samples and in data reduction, review, and reporting; and, by carefully maintaining the data, files, and documents.

It is the responsibility of the Ethics and Compliance Officer and the Management Committee to implement, establish, and maintain the Laboratory Ethics and Data Integrity procedures and policies.

It is the responsibility of Management to provide sufficient resources to effectively operate all aspects of the Ethics and Data Integrity program.

Controlled Document

4.6.1.3 Quality Policy

It is the policy of Micro Methods Laboratory that all data products generated is of the highest quality, meeting or exceeding the data quality objectives of each project. Managers, supervisors, and analysts share the responsibility of insuring that analytical methods, instruments, parameter detection and quantitation are such that the data product is scientifically sound and adequately documented. Utmost importance is placed on the quality of all the data produced by this laboratory and that it be well defined and communicated to the data user or client. This policy is accomplished by:

1) Having and following a formalized, complete, and systematic process of quality control activities which define data quality;

2) Insuring that data quality is completely documented and communicated to all data users by assigning appropriate data qualifiers to prescribed procedures;

3) By having a data cross check system review process to verify that data are generated in accordance with sound and appropriate technical procedures and by ensuring that all activities associated with the analyses, calculations, and data reduction are complete and accurate;

4) Maintaining data integrity, validity, and usability;

5) Assurance that analytical measurement systems are maintained in an acceptable state of accuracy, stability, and reproducibility;

6) Detection of problems through quality control indicators recoveries of surrogates, matrix spikes, and matrix spike duplicates, by duplicate measurements of samples, blank determinations, standard checks, and instrument calibration;

7) A system of established corrective action procedures, which keep all analytical, processes reliable;

8) Documentation of all aspects of the measurement process in order to provide data, which are technically sound and legally defensible;

9) A well-defined organization with chain of command stating clear job descriptions and responsibilities of all staff;

Controlled Document

10) A well-defined Quality Management Program with QA/QC responsibilities and system of reporting between QA and Management;

11) Assessment and audit procedures for all analytical and document control systems (internal and external sources);

12) Comprehensive training for all employees engaged in making decisions affecting the quality of laboratory output;

13) The use of properly prepared and documented reagents, chemicals and standards (expiration dates established);

14) Continued participation in certification programs and inter- laboratory testing programs recognized by an accredited organization (APG Water Supply Study and APG Water Pollution Study, APG DMRQA, AIHA, etc.);

15) Establishing and documenting policies and procedures to ensure the protection of clients' confidential information and proprietary rights;

16) The establishment of an Ethics and Data Integrity Program with oversight by Management and the Ethics and Compliance Officer (ECO)

4.6.1.4 Service Policy

Micro Methods Laboratory is an analytical service organization focused on customer needs as related to satisfaction with their data product. Our service policy is founded on two principles:

1) Communication: This principle most often involves simple conversations in order to convey a more complete understanding of the data quality objectives, but is also used to assist the data user in better understanding analytical capabilities and limitations. Good and frequent communications also enhance the ability to learn about the client's emerging needs, providing opportunity to plan accordingly. Micro Methods Laboratory management and staff are proactive in the initiation of these communications. Communications lines are always open. Clients are encouraged to monitor the laboratory's performance through on-site audits, field QC, etc...

Controlled Document

2) Timeliness: The timing of delivery of the final data product is often a critical and vital part of the overall service performed. It is the policy of Micro Methods Laboratory to never compromise Safety, Integrity, or Quality for the sake of Timeliness. However, timeliness is a driving factor in customer satisfaction. It is the responsibility of all management and staff to maintain a high degree of attention toward providing the data product to the data user in a timely manner, as established by project objectives or client needs. In the event that circumstances result in not meeting data delivery timelines, the customer must be contacted and notified of the issues surrounding the late data and to keep the data users abreast of the progress of the project.

4.7 Progressive Discipline Policy

4.7.1 When it becomes necessary to change an employee's performance or behavior from acceptable to unacceptable, this Progressive Discipline Policy provides the means to accomplish this in a fair and consistent way. When Management determines there is just cause for disciplinary action, the following steps used in the process are outlined below. However, based on the seriousness of the offense, Management may apply any level of disciplinary action or termination.

Verbal Correction—The supervisor or Lab Director will provide verbal correction to the employee. A written record of this correction shall be placed in the employee's personnel file.

Written Correction—If the employee does not correct his or her behavior, the supervisor shall consult the Lab Director and prepare a written correction. The employee shall be required to sign indicating receipt of a copy of the written correction, and a copy shall be placed in the employee's personnel file.

Suspension without Pay—If the written correction does not correct the problem, the employee may be suspended without pay for a minimum of two days. The Lab Director shall approve this suspension without pay.

Termination—When all other means of discipline have been used, or when the offense justifies such action, the employee may be terminated. The supervisor may

Controlled Document

recommend termination of employees. Management, who shall determine the action to be taken, shall review recommendations.

If the employee feels that the termination is unfair, he or she may fully utilize the open door policy.

Management reserves the right to enter into any level of disciplinary action or termination based on the severity of the offense requiring discipline and the employee's past work history.

4.8 Level of Quality Assurance

4.8.1 Quality Assurance Objectives for precision and accuracy are derived from the requirements stated by the Methods employed. Each Method specifies the use and frequency of blanks, calibration standards, calibration check analyses, surrogates, and matrix spike compounds to monitor the performance of the Method and analyst.

4.8.2 The reliability of the data generated by the Laboratory shall be reviewed by the Quality Assurance Officer or his designee and evaluated at the 99 percent confidence level (mean +/-3 standard deviations) for Control Limits and at the 95 percent confidence level (mean +/-2 standard deviations) for Warning Limits. These control limits shall be used as the basis for acceptance or rejection of criteria for each method. In cases where control limits are specified by the method, these limits shall be used until 20-30 data points are acquired, then lab generated control limits shall be calculated and used to assess batch acceptability as required. Precision shall be calculated from sample duplicates or matrix spike duplicates, check standards, and performance evaluation samples.

4.8.3 In the event that there exists no acceptance/rejection criteria, the laboratory shall generate control limits by spiking samples or lab reagent water, calculating the precision and accuracy of the samples and establishing the control limits based on 20-30 results.

4.9 Precision and Accuracy

4.9.1 The Quality Assurance controls for precision and accuracy are taken from those established by EPA in the Methods to demonstrate Laboratory capability. Control charts are generated on the parameters of interest while the system is in control. Control limits produced within the lab shall take precedence over EPA- listed control limits, if lab control is more stringent.

Controlled Document

4.9.2 Precision is the degree of agreement between replicate measurements of the same parameter under prescribed, similar conditions. Precision from replicate measurements is calculated between two measurements as Relative Percent Difference (RPD) as follows:

$$RPD = 100 * \frac{A - B}{(A - B)/2}$$

where: A = Result (concentration)
B = Duplicate Result (concentration)

4.9.3 If three or more replicate measurements are made, the Relative Standard Deviation (RSD) shall be calculated instead of RPD. The following formula shall be used to calculate RSD, when required:

$$RSD = (s/x) \times 100$$

where: s is the standard deviation and x is the mean of replicate values.

4.9.4 Accuracy is the degree of agreement between the true value of the parameter being measured and the observations made according to the test method. Accuracy shall be determined by comparison of the environmental sample results to certified reference samples or as percent recovery of matrix spikes.

4.9.5 Accuracy shall be evaluated by calculating the Percent Recovery of the spiked compounds as follows:

Accuracy = Percent Recovery

$$\text{Percent Recovery} = 100 * (A/B)$$

Where: A = Quantity determined by analysis minus the amount found in the un-spiked sample
B = Spike amount added to the sample

Controlled Document

4.8.6 The results of the analysis of spiked samples are used to detect interferences due to the sample matrix/type by comparing the matrix spike recoveries to lab control spikes When deviations in quality are attributed to matrix related interferences, they shall be noted in the narrative of the sample.

4.9 Completeness

4.9.1 Completeness is defined as the measure of the amount of data from a measurement process compared to the amount expected under the conditions of measurement. This can be understood to be that all the analyses requested by a client were done properly and in accordance with the Methods or SOPs as appropriate, within holding time requirements, within all QC control limits, and meeting the client's needs for the data. Completeness also refers to the ability of the lab to generate useful and understandable data. Our goal is to generate completely valid data; however, it is recognized that some samples may be lost or invalidated in the laboratory and that some results may be deemed questionable based on internal QC results. Checklists are used to help ensure that the data requested is data delivered. Several Quality checkpoints exist to help eliminate problems. Completeness also refers to the amount of data that is successfully collected and validated with respect to the amount intended in specific project design. A certain percentage of the intended data must be successfully determined for valid conclusions to be reached. Completeness is usually expressed in percent. When required by specific QA plans or deemed appropriate by Management, or requested by the client, completeness shall be calculated using the following formula (by the Quality Assurance Officer or designee):

$$\% \text{ Completeness} = \frac{(\text{number of valid measurements}) \times 100}{(\text{Number of measurements expected})}$$

4.9.2 More important than trying to quantify completeness is the identification of situations, which might hinder the collection of the samples or the timely reporting of all the results. Micro-Methods' Management stresses the importance of meeting data completeness, time, and quality requirements and maintains close account of the intervals related to each sample group. In the event that data or samples are lost or invalidated in the laboratory or that some results may be determined to be questionable based on internal QC results, every effort shall be made to correct this situation and provide the client with defensible data as requested. If Quality Checks within the measurement system reveal a problem that shall affect the final data, immediate corrective action shall be implemented. Re-extraction, re-analysis, and re-submission of data shall be of primary importance, if time requirements are met

Controlled Document

(holding times and client-required times). If, however, these requirements are not met, Micro-Methods shall, if the client agrees, request a resample at no extra analysis cost to the client or shall perform the re-sampling or shall compensate the client for the re-sample. Refer to SOP *Complaint Resolution* for further instruction on handling technical complaints. With good planning, all samples must be successfully collected, transported, analyzed and all data must be reported.

4.10 Representativeness

4.10.1 Representative ness is defined as the degree to which the data accurately and precisely represent a characteristic of a population parameter, variation of a property, a process characteristic, or an operational condition. Representative ness is a measure of how closely the measured results reflect the actual concentration or distribution of the target compounds in the sample. Sample handling protocols have been established to preserve the representative ness of the samples in custody. To further monitor and achieve representative ness, the most critical factors are addressed and controlled. Listed below are these critical factors:

1) Appropriate sample points

2) Time and environmental conditions of sampling

3) Frequency of sampling

4) Use of approved sampling equipment and procedures by trained field technicians

5) Maintenance of sample integrity from collection to disposal

6) Proper storage in temperature controlled environment with preservatives as required

7) Follow sample composting, homogenizing, and sample preparation, as dictated by the Methods or SOPs, documenting all deviations

8) Using proper pre-cleaned sample containers

9) Clean and contaminant free work spaces

10) Experienced Preparation Technicians

Controlled Document

4.10.2 Proper documentation shall establish that these protocols have been followed. Micro-Methods Analysts shall make every attempt to ensure that the aliquots taken for analysis are representative of the samples received.

4.11 Comparability

4.11.1 Comparability is defined as the confidence with which new data set can be compared to another. The generation of comparable data is a major goal of any analytical program. This characteristic implies that strict adherence to publish, proven analytical protocols and use of standard reporting techniques must be followed. Micro-Methods' analytical measurement system is structured around the adherence of fully documented protocols as prescribed by the Methods. The comparability objective is that all analyses be comparable and consistent with data from similar samples analyzed by other labs using similar instrumentation and the same methods. Participation in the APG Water Study, APG Water Pollution Study, ELPAT, AIHA, and Performance Evaluation Testing (laboratory performance testing programs) provide valuable information and a level of confidence that Micro-Methods data output is comparable to data generated by other laboratories performing the same Methods. Another source of feedback of comparability is through interchange of technicians performing the same analysis on the same samples under the same conditions. A third source of feedback can be a sample exchange program with another lab.

Controlled Document

4.12 Other Quality Objectives

4.12.1 Develop, implement, and maintain methods capable of meeting the client's needs for data usability and defensibility.

4.12.2 Ensure that all staff members receive training in basic quality technology, in sufficient depth to enable them to carry out the provisions established in this quality program.

4.12.3 Establish the level of quality of the laboratory's routine performance as a baseline against which to measure the effectiveness of quality improvement efforts.

4.12.4 Monitor the routine operational performance of the laboratory and to provide expedient solutions to problems of data quality.

4.12.5 Review established quality objectives at a minimum once a year for long-term objectives and once per quarter on short-term objectives.

4.13

4.14 Information Sensitivity Policy

4.14.1 The information sensitivity policy is intended to assist employees in determining what information can be disclosed to non-employees and establishing the relative sensitivity of information that must not be disclosed outside of the organization without proper authorization.

4.14.2 The information may either be stored or shared via any means. This would include at least the following: electronic information, information on paper, and information shared orally or visually (such as recorded telephone conversation).

4.14.3 It is the responsibility of all employees to understand and follow the information guidelines established within this policy.

4.14.4 There are three main classifications of information that apply to the data and information acquired and generated within the organization.

A) **Public**—is information that has been declared public which can be freely given to anyone without the possibility of damage to the organization. Examples are business cards, brochures, and employee credentials for specific jobs or responsibilities.

B) **Confidential**—contains all of the controlled information generated by the organization. It is understood that some information is more sensitive than other information and must be protected. This type information would include analytical operating procedures, research applications, and client lists. Any information affecting the business success, improvement,

Controlled Document

operations, development, or proprietary information is considered to be confidential and must not be released without authorization from Management. Also included in the list of confidential information are the following: telephone directories, corporate information, personnel information, etc.

C) **Third Party Confidential**—includes all information belonging to or pertaining to clients or approved subcontractors that has been entrusted to this organization. Examples of this classification are joint development, vendor lists, analytical services provided to clients, supplier information, project locations, sample identification, etc. Third party confidential information must not be released without authorization from Management and the third party.

4.15 Confidentiality and Proprietary Rights

4.15.1 The confidentiality of the client is of the utmost importance at Micro-Methods. The analysis results of each client are the proprietary information of that client and no one else. When work is requested, a work order is written consisting of the following:

1) The company or the individual for which the work is being done.
2) The analysis requested.
3) The person's name requesting the work.
4) Phone and fax numbers of where the results should be sent. The names on these work orders are the only people contacted concerning the analysis performed.

4.15.2 No information concerning samples, analysis or results is given in any form to anyone but the client designated to receive this information. Clients are requested to confirm that they have received results or information that is sent via fax or email. Fax numbers and email addresses are checked to determine if they are valid addresses.

4.15.3 All employees at Micro-Methods have signed a letter of confidentiality proving they have been informed of this company policy.

4.15.4 Micro Methods, as routine policy, respects and honors client/laboratory confidentiality. Only Management or approved designees are allowed to give verbal results to clients. Employees are warned that discussing results of analyses with anyone outside of work is forbidden and could result in termination if this is done. We respect the rights of our clients and make every attempt to ensure confidentiality.

Controlled Document

4.15.5 Occasionally clients shall request for confidentiality, generally for samples or documentation that possibly could go to litigation. These samples or documents must be accompanied by a written request of confidentiality. Management shall assign the documents or samples to an individual or individuals to be solely responsible for the handling of the documents or samples under the supervision of the Lab Director or the Document Control Officer (Office Manager) as appropriate. All data generated from confidential samples shall be treated as confidential, as are the samples.

4.15.6 Confidential documents shall be logged into a confidential inventory log by the DCO or designee. A separate locked file shall be maintained to store this information and shall be segregated from other non-confidential files. The Office Manager is responsible for the locked file cabinets in the front office. All authorized confidential documents shall be kept under lock until the authorized parties request the documents. Only Upper Management or designees are allowed access to confidential documents, which must be signed out and returned before 4:30pm of each working day. Confidential information may not be reproduced except by written authorization from the person or persons requesting the confidentiality. Records of any copies shall be entered into the confidential inventory log with any other correspondence. All correspondence concerning the confidentiality shall be between the authorized person or persons employed by Micro Methods and the original requestor of confidentiality or their designees. In addition, this information may not be disposed of except upon approval by the requestor. The DCO shall remove and retain the cover page of any confidential information disposed of for one year and shall keep a record of the disposition in the confidential inventory log. The same securities exist for samples and their extracts.

4.15.7 During audits by clients or regulatory agencies or when visitors are on-site, all employees must do their utmost to protect the confidentiality of our clients. No discussions, in the presence of visitors related to other clients' samples, reports or information specific to the other clients' samples, reports or other information are allowed. No phone calls announcing the party calling are allowed. No phone calls announcing who the individual is making the call or with what company they are employed.

4.15.8 During audits by clients or client representatives all employees shall make every effort to protect other clients' confidentiality. The auditor shall only have access to reports and data related to the company that the auditor represents. Other clients' names or sample information contained in logbooks, run sequences, and raw data shall be covered to the extent possible. Whenever possible client names should not be recorded in open logbooks, only the laboratory ID and sample information. Copies of data with

Controlled Document

other clients' names shall be "blacked out" or concealed in some way. Logs generated from the LIMS should not contain client names and are preferred because it allows client specific data retrieval without compromising other clients' confidentiality. Sample labels shall not contain client names and only information that does not compromise the confidentiality of clients or their data.

4.15.9 If the courts subpoena records, the representative or attorney shall only have access to the records requested by the court. In addition when review of these records is required on site, the reviewer shall not be granted access to any laboratory space other than the designated office area.

4.15.10 In the event that the ownership of Micro Methods changes as a result of sale or in case Micro Methods is unable to provide client services, clients shall be notified in writing and/or by phone of the change. The clients shall be offered their records, which can either be picked up or delivered or can opt to have the records disposed of by Micro Methods representatives. Client confidentiality shall be maintained. A letter indicating the clients' options shall be sent to the client. After the client returns the letter Micro Methods shall perform the records return or disposal as requested documenting the activity.

4.15.11 Subcontractors performing analytical services for Micro Methods Laboratory shall also be subject to all confidentiality requirements and may be required to sign confidentiality agreements, depending on the type work and client.

4.15.12 Client auditors and/or client representatives shall also be subject to all confidentiality requirements and may be required to sign confidentiality agreements prior to the audit.

4.15.13 A designated employee shall escort all visitors and auditors requiring access into the laboratory.

4.15.14 Clients submitting samples shall not be allowed access to the laboratory without an escort.

4.16 Departures/Deviations from Documented Policies, Std. Specs, or Procedures

4.16.1 All deviations from existing procedures, work plans or policies must be documented in bound notebooks, bench sheets, or on the raw data as to the extent of, and reason for, the deviation. The Lab Director must approve all deviations in writing. Analysts or Lab Supervisors. Technicians do not have authorization to change or deviate from prescribed procedures without prior approval from the Lab Director or

Controlled Document

Lab Supervisor. Analysts shall discuss changes with their immediate supervisors. The supervisors shall act as intermediate to discuss the change options with the Lab Director. Prior to the deviation, where possible, the Lab Supervisor shall contact the clients for their approval of any deviation. No deviation impacting data shall be implemented without approval of the client. All activities not performed in accordance with established Standard Operating Procedures or project plans are considered to be deviations and even though these deviations may or may not affect data quality, they must be documented. The Lab Director or Lab Supervisors shall initial the deviation as approval.

4.16.2 All QC failures shall be qualified in the final report and discussed in the narrative report.

4.16.3 All anomalies that affect the quality of the data must be qualified and explained in the narrative report.

5.0 PERSONNEL QUALIFICATIONS AND TRAINING

5.1 Personnel Qualifications and Training Policy

5.1.1 Micro-Methods Management policy requires that personnel performing analytical testing or duties for a laboratory function must be qualified to perform the assigned tasks. Micro Methods Laboratory management makes every effort to hire qualified employees.

5.1.2 In the event that contract personnel are used to fill laboratory positions, they shall be subject to all training requirements and shall also follow the same quality system requirements, and method requirements.

5.1.3 Analysts performing methods must possess minimum education and performance relative qualifications as established by policy.

5.1.4 Analysts shall complete an external or internal training program for the tasks for which they shall be assigned. Analysts shall not perform methods or tasks for which they have not been trained.

5.1.5 The training shall be documented for each procedure. The supervisors shall train analysts and subordinates for the tasks they perform. The QAO shall maintain the Quality related training records and the Lab Supervisors shall maintain the Technical related training records. Each method shall be evaluated, as shall each analyst, by

Controlled Document

demonstrations of capability and continued acceptable testing results. Personnel shall be proportioned such that adequate supervision is ensured.

5.1.6 The Lab Director shall certify and document this certification that personnel with appropriate education and or technical background perform all tests.

5.1.7 Management shall evaluate each position to determine the necessary qualifications for personnel to perform their technical and quality duties and responsibilities in a safe and effective manner. The qualifications shall be documented in terms of education, experience, training, and technical knowledge and shall reflect the hazards and risks associated with the positions.

5.2 Job Qualifications/Position Titles

Micro-Methods shall not discriminate against any employee because of race, color, religion, sex, or national origin.

5.2.1 Laboratory Director

The Laboratory Director must have a bachelor's degree in science, preferably in chemistry or a minimum of four years equivalent experience in a related field. The Laboratory Director must have a minimum of two years job related experience in the area of environmental analysis.

5.2.2 Technical Director/Quality Assurance OfficerAssurance Officer (QAO)

The Technical Director/AO must have a bachelor's degree in science, preferably in chemistry or four years equivalent experience in a related field. The Technical Director/AO must have a minimum of five years environmental laboratory experience. The Technical Director/AOmust have a general knowledge of all analytical methods performed at the laboratory. Training shall be documented.

5.2.3 Lab Supervisors (Organic, Inorganic)

Organics and Inorganic Supervisors must have a bachelor's in science, preferably in chemistry with at least 24 college semester credit hours in chemistry. Supervisors must have a minimum of four years experience in the area they are to supervise and six months prior supervisory experience in the field they are to supervise, in accordance with LAC Title 33, Part 1, subpart 3, sec 4901-D.

5.2.4 Analysts/Technicians

Controlled Document

Analysts/Technicians (General Chemistry) must have a high school diploma and documented in-house training for all methods they are assigned. Analysts/Technicians shall be adequately supervised.

5.2.4.1 Analyst/Technicians Metals Instrument Operators) must have a high school diploma with six months documented training for all methods and instruments used.

5.2.4.2 Analysts/Technicians (GC or GC/MS) must have a high school diploma; BS in science or Chemistry preferred with six months documented training on all instruments and methods to which they are assigned. Trainees shall be adequately supervised.

5.2.4.3 Analysts/Technicians (Industrial hygiene) must have a high school diploma and attend a NIOSH 582 training course for asbestos fiber counting and a supervisory course for sampling. Individualized training is required.

5.2.5 Officer Manager

Employee must have a high school diploma and clerical training with a minimum of two years clerical experience with accounting skills.

5.2.6 Clerical Staff

Employee must have a high school diploma and undergo six months of on-the-job-training in a clerical setting.

5.2.7 **Sample Custodian**

Employee must have a high school diploma and undergo specific training from the SOP for Sample Log-In and Sample-Handling. Computer training is required.

Controlled Document

5.3 On-the-Job Training and Certification

5.3.1 Refer to SOP ***Training*** DCN: 3014 for detailed information.

5.3.2 All employees shall receive some type of on-the-job training commensurate with their experience and background to enhance their acquired experience and education.

5.3.3 All Analysts/Technicians shall be adequately supervised. When changes to work groups occur the technician shall be partnered with a more experienced technician or shall work directly with the supervisor to accomplish the tasks.

5.3.4 The data produced by the trainee shall be validated and verified by the Supervisor or Lab Director.

5.3.5 Analyst training shall be considered up to date if an employee file contains a certification that personnel have read, understood, and agreed to perform the most recent version of the approved method or SOP, and documentation of continued proficiency by at least one of the following once per year or when there are personnel changes within the work group.

1) Perform a blind sample at an acceptable level.
2) Demonstrate method performance.
3) Successful analysis of a blind performance sample on a similar test method using the same technology would only require documentation for one of the test methods.
4) Perform at least four consecutive laboratory control samples with acceptable levels of precision and accuracy.
5) If one of the above cannot be performed, analysis of authentic samples that have been analyzed by another trained analyst with statistically identical results.

5.3.6 In circumstances where a work group is required to perform a method or procedure, the individual shall receive certification when the final acceptance criteria are met. Demonstration of capability applies to the group as a whole. Training records shall reflect the individual performance in the process. The above requirements apply to the work group as well. In the event that any of the Quality indicators for the first four analytical batches fail, the problem must be investigated, corrected, and the demonstration of capability performed again.

5.3.7 The following documents shall be used as evidence of capability and training:

Analyst(s) Name(s):

Matrix:

Method Number, SOP#, Rev# and Analyte or Class of analytes or Measured Parameters:

We, the undersigned CERTIFY that:

1. The analysts identified above, using the cited test method(s), which is in use at this facility for the analyses of samples under the National Environmental Laboratory Accreditation Program, have met the Demonstration of Capability.
2. The test method(s) was performed by the analyst(s) identified on this certification.
3. The test method(s) and the laboratory-specific SOPs are available for all personnel on-site.
4. The data associated with the demonstration capability are true, accurate, complete and self-explanatory (1).
5. All raw data (including a copy of this certification form) necessary to reconstruct and validate these analyses have been retained at the facility, and that the associated information is formally organized and available for review by authorized assessors.

_____	_____	_____
Lab Supervisor/Lab Director	Signature	Date
_____	_____	_____
QAO	Signature	Date

For Quality, Ethics, and Data Integrity Training
1) These analyst/technicians have received the Quality Related Training listed below.

Controlled Document

For Procedures and Methods
2) These analysts/technicians have read the SOP (if available) for the training listed below.
2) These analysts/technicians have signed documentation of the training.

3) These analysts/technicians have demonstrated his/her (their) understanding of the requirements related to the training

4) The training was a requirement of the Quality Assurance Manual and the SOP *Training* DCN 3014 to meet current LELAP/NELAP Standards.

Training:_____
Based on Reference Method or SOP DCN#_____
Date of Training:_____ Instructor:_____

Analyst/Technician/Management	Date of Training		

As required in Micro Methods Laboratory's Training Program, this employee has received the following Quality related training or continuing quality training:

Controlled Document

Quality Training	Date Certified/ Trained	Certified/ Trained by	Technician

For Technical, Administrative, or other Training
1) These analyst/technicians have received the Technical Training listed below.

For Procedures and Methods

Controlled Document

2) These analysts/technicians have read the SOP for the procedure listed below.
3) These analysts/technicians have observed a trained analyst/technician perform the procedure listed below.
4) These analysts/technicians have, under direct supervision, performed the procedure listed below.
5) These analysts/technicians have demonstrated his/her (their) ability to perform the procedure listed below based on the requirements established in the Quality Assurance Manual and the SOP *Training* DCN 3014.

These Analyst/Technicians are qualified to perform the procedure listed below while employed at Micro Methods Laboratory, subject to continued acceptable performance of the procedure and annual re-certification.

Procedure:_____
Based on Reference Method or SOP DCN#_____
Date of Training:_____ Instructor:_____

Analyst/Technician	Date of Training		

5.4 Mandatory Training

5.4.1 All employees shall undergo mandatory training by management, QAO, and outside instructors in the following areas:

Controlled Document

1) Fundamental principles of quality training.
2) The organization's QA policies and procedures.
3) Technical skills for the tasks to which they are responsible.
4) Safety Training.
5) New Employee Orientation.
6) Detection and Deterrence of Laboratory Fraud (Ethics Training)
7) Data Integrity Training

5.5 Training Frequency and Training Responsibilities

Title of Training	*Frequency*	*Responsible Trainer*
New Employee Orientation	Within first month of employment	Lab Supervisor, Office Manager, and QAO
Fundamental Principles of Quality (includes familiarization and review of the QAM and support documentation)	Within first month of employment—annually thereafter or whenever significant changes are made to the quality system	Quality Assurance Officer
Micro Methods QA Policies and Procedures	Within first month of employment—annually thereafter or whenever significant changes are made to the quality system	Quality Assurance Officer
Technical Skills Training	As required for the position—refresher training annually	Lab Supervisors
Laboratory Safety Training	Initial Training within first month of employment—regular monthly meetings	Safety Officer or designees
Detection and Deterrence of Laboratory Fraud (Ethics Training)	Within first month of employment—annually thereafter or whenever ethics topics need	Quality Assurance Officer, Lab Director, or Ethics and Compliance Officer

Controlled Document

	discussion	
Data Integrity Training	Within first month of employment—annually thereafter or whenever data integrity topics need discussion	Quality Assurance Officer, Lab Director, or Ethics and Compliance Officer

5.6 Training Records and Performance Documentation

5.6.1 Files shall be maintained for all employees undergoing training, documenting the extent of the training.

5.6.2 It is the responsibility of the QAO to maintain all quality related training files. It is the responsibility of the Lab Supervisor to maintain all technical training files.

5.6.3 It is the responsibility of the Lab Director and Lab Supervisors to perform in-house documented training or find suitable external training when training is needed that exceeds their realm of expertise.

5.6.4 The QAO and the Supervisor, who performed the training, must authorize the training in writing and certificates.

5.6.5 All training documentation shall be controlled.

5.7 Trainer Qualifications

5.7.1 The Laboratory Supervisors and the Laboratory Director shall be the primary technical trainers.

5.7.2 The trainers shall possess the education and experience as stated in 5.2.3 as a minimum.

5.7.3 The trainers must have documentation of acceptable performance of their ability to perform the tasks for which they train.

5.7.4 The QAO shall be the primary trainer for quality and ethics training.

Controlled Document

5.7.5 Management must approve external sources for training, instruction, or certifications.

5.7.6 It is the responsibility of Management and the Laboratory Director to assure that if an external source of training is required that the technician receive this type of training before being assigned tasks of this nature.

5.8 Designing Specific Project Training Programs

It is the responsibility of the Laboratory Director, Laboratory Supervisors, and the QAO to review technical training requirements for all specific projects and if additional training is required, initiate action that would satisfy the training requirements.

5.9 Assessing Training Effectiveness

5.9.1 Training effectiveness shall be assessed by the acceptability of the internal technical controls applied to the systems.

5.9.2 Training effectiveness shall be assessed by feedback from technicians through questionnaires.

5.9.3 Training effectiveness shall be assessed by performance evaluations (internal and external).

5.9.4 Training effectiveness shall be assessed by written examinations.

5.9.5 Training effectiveness shall be assessed by proficiency checks periodically. The technician shall list the steps of the method checked and perform test calculations.

5.9.6 Training effectiveness shall be assessed by technician analysis of blind samples.

5.9.7 For technicians responsible for data reduction shall be given sets of data to validate. Proficiency shall be judged in terms of completeness and accuracy.

5.9.8 All proficiency checks shall be documented and retained in personnel files.

5.9.9 As necessary, oral interviews shall be used to determine whether training efforts were effective.

Controlled Document

5.9.10 All assessments and interviews are the responsibility of the Lab Supervisors and/or Lab Directors.

5.9.11 It is the responsibility of the QAO and the Lab Director to monitor, review, and initiate changes and improvements to the training program as required.

It is the responsibility of each analyst and technician to meet the strains of the workload and the needs of our customers by training as a secondary or back-up analyst on each routinely used method. This is necessary to maintain continuity of services through vacations, sick leave, and for other times when the primary analyst is unable to perform the assigned tasks. Each back-up analyst must demonstrate competence by completing an initial demonstration of capability study and have documentation on file.

5.10 Required Reading

5.10.1 It is the responsibility of each employee to read the most current version of the Quality Assurance Manual and the NELAC standards. This shall be done within the employees first 3 months of employment and annually thereafter.
5.10.2 Documentation of the reading of these documents shall be maintained in the employee's Quality Training file.
5.10.3 Written examinations shall be required verification and documentation that each employee has read and understood the Quality Assurance Manual and the NELAC standards.

6.0 PROCUREMENT OF ITEMS AND SERVICES

6.1 Purchasing

6.1.1 Purchasing and procurement for Laboratory consumables is the responsibility of the Office Manager and/or designees authorized by the Officer Manager, known as the Purchasing Agent.

6.1.2 Analyst/Technicians are responsible for the stock supplies for the work tasks to which they are assigned. Purchase requisition forms are required to initiate a purchase. Any employee may initiate a purchase requisition for routine, approved consumables without the signature of the Lab Supervisor. Routine orders consist of standards, reagents, and other approved consumables. Non-routine orders are standards that are ordered on an as-needed basis or a deviation from standards currently being utilized in the laboratory. No analyst may order non-routine products without authorization. The request for non-routine products must be authorized by

Controlled Document

signature of the Lab Supervisor or the Lab Director who reviews for meeting specification requirement. The approved request is then forwarded to the Purchasing Agent. The requisition form must be filled out properly with all information necessary to purchase the correct consumable.

6.1.3 The Purchasing Agent initiates a Purchase Order, checks the approved vendor list if a specific consumable product and manufacturer is not requested, then requests pricing from various approved sources (if available, a minimum of three quotes). The Purchasing Agent shall accept the lowest priced quote for the material described on the requisition form. The Lab Supervisor, who must check product specifications to determine if the substitute is acceptable, shall accept no substitutes in quality without authorization. Higher price quotes may be accepted if product quality does not meet the minimum required specifications. The Lab Director and Management must approve these deviations.

6.1.4 The Purchasing Agent shall constantly verify pricing and at least annually request quotes from at least three vendors for all high consumable items.

6.1.5 Contract Prices shall be entered into the column on the Purchase Order. These prices shall be checked by Accounting to verify when the invoices are received.

6.1.6 Purchase orders, receiving documents and accompanying product certifications and specifications are retained by the Purchasing Agent or Officer Manager as part of the receiving control procedures and also are a record of the information necessary to identify and trace the material being received.

6.2 Approved Vendor Selection/Subcontracting Analytical Services

6.2.1 All consumable material (standards, solvents, reagents, glassware, office supplies, instrument consumables, and general lab consumables) shall be purchased from the Approved Consumables Vendor List. All instrumentation shall be purchased from the Approved Instrumentation Vendor List.

6.2.2 All Vendors/Subcontractors selected as suppliers shall be approved by the Lab Director based on the following criteria:

1) Vendor must follow a quality system acceptable to NELAC's requirements (ISO-9000, A2LA, ANSI/ASQC or NELAC).
2) Vendor must provided a product that meets or exceeds the requirements needed for the use that it is intended.

Controlled Document

port.

6) Vendors/Subcontractors of testing or analytical supplies and materials used in testing are regarded as a resource to an extension of the laboratory organization. Micro Methods Laboratory is responsible for the subcontractor's work, except in the case where the client or a regulatory authority specifies which subcontractor shall be used. The standards for quality, therefore, imposed on vendors are the same standards imposed on the laboratory. Micro Methods shall use only those outside support services and supplies that are of adequate quality to sustain confidence in the laboratory's tests.

7) Prior to submitting work to the subcontractor, the client shall be contacted and advised of the subcontracting arrangement, first by phone and if approved shall send notification in writing for approval by the client, when necessary.

8) Work requiring NELAP accreditation shall only be sent to NELAP accredited laboratories with accreditation for the scope of work subcontracted. The subcontracted laboratory must also meet applicable statutory and regulatory requirements for performing the work and submitting the results of the tests performed.

9) All testing performed by the subcontractor shall be reported using the subcontractor's letterhead and shall clearly indicate any non-NELAP accredited work.

10) The Office Manager and Sample Custodian maintain a list of the subcontractors that have been approved to provide analytical services for Micro Methods Laboratory.

6.3 Changes to Procurement Documentation

6.3.1 Changes to Procurement Documentation shall be done in accordance to procedures established by management consistent with controlled documentation policies. Procurement documents are controlled documents subject to all appropriate guidelines, as required in Section Seven of this Manual.

6.3.2 The Purchasing Agent and the Office Manager shall maintain procurement documentation of all items affecting the quality of the test results and data output.

6.4 Control of Incoming Material and Standards

6.4.1 The Purchasing Agent receives the incoming testing materials and standards that have been ordered. The agent inspects the shipping container for visible damage

Controlled Document

while the carrier is present. Packages shall be rejected that have obvious outward damage. If rejected, the agent, identifying the material and the reason for the rejection, shall initiate a Material Rejection Form. The agent shall unpack the container and again visually inspect the contents. The agent shall check the package marking and the packing slip against the approved purchase order. If a discrepancy is detected that could affect analytical or testing accuracy or precision, the material shall be rejected. If accepted by the agent, routine consumables shall be stored in their proper areas. Non-routine consumables, such as standards and reference materials shall be forwarded to the person who ordered that material or to the Lab Director or Supervisors. If accepted the material or standard shall be labeled (date received and date the material or standard is opened for use along with whomever received the standard or reagent – initials required). The person receiving the standard with the date received for ready retrieval shall initial the Certificate of Analysis. The information about the standard, reagents, or reference material shall be recorded in a standards inventory log (standard name, manufacturer, date received, date opened, expiration date, lot number, catalogue or order number, and standard control ID name). If the material is rejected, a corrective action form shall be initiated.

6.4.2 Standards and materials shall not be used after the manufacturer's recommended expiration date. The Laboratory shall not use reference material if more than 5 years from receipt date if an expiration date is not known.

6.4.3 Materials are stored according to recommendations by the manufacturer or EPA in "last in – last out" order. Materials are used or issued on a "first in – first out basis. Materials with a finite shelf life are plainly marked with an expiration date.

6.4.4 Most standards, solvents, glassware, and other consumables are purchased with certificates of analysis from the distributor. For those that have no certifications, the laboratory shall perform incoming inspections as prescribed by EPA or shall use an approved sampling plan to satisfy the inspection and specification requirements for the material. Written inspection instruction shall be used in this case. Full documentation on a corrective action form (no certificate of analysis) is required.

6.4.5 Although it is a requirement of this quality system to use vendors that employ an approved quality system which uses independent auditors, there may be occasions when Micro-Methods' QAO shall need to perform an audit of a vendor's quality system. When this occurs, the Quality System Survey Evaluation Check List is used to evaluate the system.

Controlled Document

7.0 DOCUMENTS AND RECORDS

7.1 Definitions of Document and Record

7.1.1 For the purposes of these requirements a document is defined as a volume of information that describes, defines, specifies, reports, certifies, requires, or provides data or results pertaining to an environmental program. A record is defined as a completed document that provides objective evidence of an item or process. A document, which contains objective information, can become a record once it is complete and then is identified as a record.

7.2 Document Life Cycle/Document Revisions

7.2.1 All controlled documents shall contain a Document Control Number, a current revision number, the date of the revision, and the date the document/procedure was implemented (in the document header) and shall be approved by the Lab Director and the QAO. All controlled documents shall be in effect for a maximum period of one year from the revision date. The controlled document shall be reviewed prior to the end of the effective period and shall either be revised (if changes are required) or shall be approved for use. For bench sheets and work sheets only the current revision is required for use. Revisions to controlled documents are required whenever there is a change in laboratory operations, standard requirements, instrumentation, or changes to methods or procedures.

7.3 Identifying Quality Related Documents and Records Requiring Control

The elements of the Quality Systems to which document control is applied are listed below.

7.3.1 SOPs include, but are not limited to:

1) Sampling Procedures
2) Calibration Procedures
3) Analytical and Test Procedures
4) Auditing Procedures
5) Data Validation Procedures
6) Data Collection Procedures
7) Reporting Procedures
8) Management Procedures

Controlled Document

7.3.2 The Quality System Manuals

7.3.3 The Quality Assurance Manuals

7.3.4 Laboratory Notebooks and Logs

7.3.5 Calibration and Preventive Maintenance Documents

7.3.6 Reports include, but are not limited to:

1) Analytical and testing reports
2) Validation Reports
3) Internal Audit Reports
4) External Audit Reports
5) Vendor Reports
6) Chain of Custody Documentation.

7.3.7 Technical change Documents
7.3.8 Corrective Action Documents
7.3.9 Planning Documents
7.3.10 QA Project Plans
7.3.11 Field Sampling Notebooks and Logs
7.3.12 Personnel Qualifications
7.3.13 Technical and Readiness Reviews Results
7.3.14 Analytical QC Data
7.3.15 Chemical Hygiene Plan
7.3.16 Purchasing Documents
7.3.17 Computer Generated Records (Raw Data, Hardcopy, and backups) and CDs
7.3.17 Document Master Files
7.3.18 Controlling Documents

7.3.19 All controlled documents shall be assigned a Document Control Number (DCN), unique and serially ascending, recorded in Document Control Master File. Document control is the responsibility of the Document Control Officer (Officer Manager or designee). Controlled documents shall follow tracking and custody procedures for record of possession for the duration of the life cycle of the data.

7.3.20 The Document Control Master File shall contain the following information:

Controlled Document

1) Document Control Number (DCN)
2) Client
3) Lab File Number
4) Revision
5) Date
6) Technical Change Number
7) Document Control Officer

7.4 Controlled Document Handling/Record Maintenance

7.4.1 Controlled documents shall be accessible to Management and Lab Supervisors and Analysts assigned to specific tasks related to these documents. Strict custody and possession trails are followed. Employees needing controlled documents are required to "sign out and sign in" the document. Documents must be returned to the file storage area as soon as possible.

7.4.2 Records and documents shall be traceable from initiation of the work plan until disposition of the data. Records shall reflect trace ability.

7.4.3 To facilitate accessibility and use, record formats shall comply with the format required for analytical data by Good Automated Laboratory Practices (refer to Chapter 8.0 of this document) (GALP) (ref 5).

7.4.4 All internal documents shall be issued and distributed by a designee of Management.

7.4.5 Data shall only be transmitted and released to the primary contact or client who requested analytical services. Fax and e-mail transmittals shall only be done at the request of the client. Standard courier services shall be used for delivery of data. Confidentiality is a main concern. Only authorized employees shall submit verbal results. Results submitted verbally can be used only for information and not the official expression of laboratory results. Only hardcopy results, fax or email results are official laboratory results.

7.4.6 Controlled files shall be maintained in locked; metal, fireproof file cabinets for a minimum of six months or as long as required. Files shall then be moved to a permanent storage area for ten a minimum as required by LELAP our primary accrediting body. Micro-Methods makes every attempt to maintain all files for longer periods; however, lack of available storage space may preclude this practice.

Controlled Document

7.4.7 Files shall be stored and handled carefully, so as to minimize potential for damage or deterioration. Adequate pest, temperature, and humidity controls shall be applied to protect stored files.

7.4.8 Management is responsible for providing the resources to properly maintain the controlled files and records, including computer generated data for a minimum of seven years. The Document Control Officer is responsible for reviewing documents for disposal, and contacting clients concerning their records prior to disposal to determine if the client may want the documents scheduled for disposal. The DCO shall retain and maintain all records of disposition of documents. Management shall assure that a system of document control includes simple retrieve ability by authorized personnel. Document disposition shall be the responsibility of the Document Control Officer, Office Manager, or designee and shall have the approval of the Lab Director.

7.4.9 Disposition of controlled records and documents shall be strictly controlled, so as to protect the confidentiality and proprietary rights of the client.

7.4.10 Following the issuance of the final report to the client, the final report shall remain unchanged. If problems with the report are discovered by the client or during internal data audits the reports shall be revised and the revision issued, but the original report must be left intact. Revisions to the report must meet the LAC 33 requirements. (See *SOP General Office Procedures* DCN 6000).

7.4.11 Archived Quality System Documents (i.e. Quality Assurance Manual, Quality Management Plans) are maintained in hardcopy, marked Archived (original signed and approved documents) by the DCO for a minimum of 7 years after the documents have been revised or archived.

7.4.12 Original signed and approved technical SOPs (in use) are also maintained by the Lab Supervisors. Copies only are issued for work or when requested for review by auditors or clients.

7.5 Use and Maintenance of Laboratory Notebooks

7.5.1 It is the responsibility of the QAO to issue notebooks to employees whose tasks require documentation of analytical or support operations. Notebooks are the physical property of Micro Methods and their contents are to be kept confidential. The employee who signs for and receives a notebook must safeguard it and see that it is returned for cataloging and storage after completion. Notebooks must be surrendered at termination or when the notebook is completely filled. Notebooks are

Controlled Document

issued to the Lab Supervisors (when needed) for recording testing information. Entries must be permanent, clear, complete, and made as soon as possible after the event being recorded. The person or persons involved in the work must be identified and proper witnessing is essential. The notebooks are to be used to record all communications and work related to the analytical activities of the laboratory for permanent record. Employees are also issued notebooks as personal diaries for daily accountability.

7.5.2 Lab supervisors will periodically inspect lab notebooks (not to exceed annually). The notebook contains space for verification signatures. The following 10 point checklist is to be used by the supervisors when reviewing notebooks to determine if the notebooks and bench-sheets are being kept properly:

Are the notes written using a black, indelible ink ballpoint pen?
Is the handwriting clearly legible?
Is the table of contents up to date?
Is each entry signed and dated unambiguously?
Does each section have a clear, grammatical heading that describes the work reported therein?
Are entries written in the first person, telling who did the work?
Is the work described completely so that the writer can understand it without additional explanation?
Is the analyst "thinking in the notebook?"
Are observations and measurements entered immediately and directly into the book, not on scraps of paper to be transcribed later?
Are entries witnessed correctly?
Is the notebook stored safely when not in use?

7.5.3 Notebooks will be stored in a secured area maintained at about 23-25 degrees C and relative humidity of 45 to 75 per cent. They are catalogued according to the sequential numbering system and when they were completed. It is the responsibility of the QAO to maintain and store these documents.

7.5.4 Corrections to data contained in lab notebooks or analyst's notebooks will be made by:

1) Drawing a single line through the error with a blue or black ballpoint pen.
2) Inserting the correction.
3) Initialing and dating the correction.
4) When clarification is needed, record the reason for changes to the data.

Controlled Document

7.6 Technical Guidance Documents

7.6.1 Preparation and review of technical guidance documents, such as Project Planning documents, Quality Assurance Project Plans, Sampling and Analysis Plans, and Standard Operating Procedures are the responsibility of Management with the assistance of the Lab Director, QAO and technical staff. Management shall assign projects to qualified staff that are responsible for establishing a data collection and assessment program, which is defensible and meets the needs of the user.

7.6.2 Technical guidance documents are written to implement and assess the project and its data requirements and results based on conformance to the Quality System and Management Plan.

7.6.3 When the plans and technical documents are deemed appropriate for the intended use, a representative of Management, Lab Director, and QAO shall approve and authorize the documents for general use.

7.6.4 The Lab Director and QAO shall review all technical documents annually for suitability. Unsuitable documents shall be retired or revised.

7.6.5 Whenever a change is made to a controlled document, the QAO shall issue the new document together with a Technical Document Change Notice to notify the user that his document has been changed or revised and specifically what the change is. This notice shall accompany the revised or changed document for its life cycle. SOPs shall include a reference to "modified" where applicable. Refer to Technical Document Change Notice Form below.

7.6.6 To facilitate the use of technical documents formats consistent with NELAP/LELAP and EPA shall be used for similar types of documents.

7.7 E-Data

7.7.1 Following project completion and data assembly and final reporting, all hard copy raw data is included in the project file as required by the reporting requirements. The hard copy of the project file is the official record. The hard copy should include hard copies of electronic records when required by the project. It is absolutely essential that the hard copies placed into the project file accurately reflect the electronic data. E-data must be maintained in its original electronic format. It is the policy of Micro Methods that:

Controlled Document

1) e-data must be maintained in a logical and documented sequence such that retrieval, if necessary, and readily available.
2) e-data must be securely filed such that there can be no unauthorized amendment of the data and that the integrity of the stored data is maintained.
3) all raw and processed e-data shall be stored in appropriate manufacturer's format, uncompressed, and with no security codes.
4) the data shall include all necessary data files for a complete reconstruction of the submitted hardcopy and electronic deliverable data package (where required).
5) All associated raw data files in the instrument manufacturer's software format must be submitted (where required) if those files contain data or instrumental parameters regarding any analysis and/or correction factors applied to an instrument or analytical results generated on the instrument.
6) archived e-data and the associated project file shall be maintained 7 years.
7) changes to electronic documents shall include revision numbers, date revised, revised by whom (header info). Previous documents shall be maintained originally intact.

7.8 Logbook Maintenance and Archival

7.8.1 Refer to *SOP Laboratory Notebooks DCN: 3003*. It is the responsibility of the Lab Supervisors to maintain all logbooks, including analysis run logs, maintenance logs, and preparation logs while in use. The analysts must enter all relevant and required information into the logbooks as permanent record. Custom bound logbooks are created whenever specific information is required.

7.8.2 It is the responsibility of the Lab Supervisors, Lab Director, and/or the QAO to determine the required information that shall be recorded in the logbooks.

7.8.3 Logbooks must be archived according to procedures for controlled documents and retained for 7 years.

7.9 Sample Delivery Group File Organization, Preparation, and Review

7.9.1 At sample log in, the sample custodian generates a Work Order Number for the delivery group in the LIMS. This identification number is used throughout the analytical process and is used as the sample group ID for entire sample group. Individual sample IDs are generated at the same time, each is a consecutive unique number.

Controlled Document

7.9.2 Sample delivery groups with IDs already determined are entered into the LIMS accordingly.

7.9.3 The Work Order number is recorded on the sample receipt sheet, which is attached to the COC, along with any instructions for the group, and all transportation information.

7.9.4 The individual Lab ID numbers are stamped or handwritten by the sample custodian on the COC for data review purposes who makes copies to route to each lab supervisor for work implementation review.

7.9.5 If there are no problems with the work, the Sample paperwork is routed to the analysts.

7.9.6 The original COC, Sample Receipt form, sample instructions, and all transportation information are routed to the Office Manager who creates a file for the group.

7.9.7 Each work area performs the analyses, enters results into the LIMS for which they are responsible, then attaches the raw data to the Copies of COC, Sample Receipt form, etc... and routes the data to the Lab Supervisor or Peer for review.

7.10 Compliance Assurance

7.10.1 Management shall ensure that records generated during the planning, implementation, and assessment phases along with all analytical work reflect a complete data product, which meets and fulfills statutory, EPA, and the client's requirements. This shall be accomplished by comparing the resulting documents with the data quality objectives, by reviewing all phases of the process, verifying, and by reviewing all phases of the process, verifying, and validating that all systems were in control, all results within the process were acceptable according to written work plans, with all work being completed in a timely manner. All documentation related to the project shall be reviewed by documentation related to the project shall be reviewed by peers for operational errors, validated by Supervisors or the Lab Director, and evaluated by QAO before release.

7.10.2 All Corrective Action reports shall be reviewed by QAO and the Laboratory Director to determine the effectiveness of the corrective action taken. Further changes shall be discussed to improve the quality of the analytical measurement system as deemed necessary and appropriate. All actions shall be documented.

Controlled Document

8.0 COMPUTER HARDWARE, SOFTWARE, and INFORMATION POLICIES

The Laboratory Information Software in use is the Promium Element system, installed in June 2006. The system is networked and offers many features that act as aids in increasing throughput and efficiency within the laboratory. In addition this LIMS provides essential security and control necessary for effective management of an automated laboratory. Micro Methods shall operate all automated laboratory operations according to the practices and guidelines of data management established in *EPA 2185 – Good Automated Laboratory Practices.*

8.1 Laboratory Information Management

For all raw data that is collected, analyzed, processed or maintained, it is the responsibility of management to:

8.1.1 Ensure that all personnel entering data into the LIMS clearly understand the functions they are to perform. LIMS users shall be provided with clear operating instructions, manuals, and SOPs to enable them to perform assigned system functions. Sufficient training to clarify these instructions is provided to users. Users who are able to meet operation requirements are eligible to perform LIMS functions.

8.1.2 Ensure that the Quality Assurance Officer and the LIMS Administrator monitor activities relating to the LIMS and its use jointly.

8.1.3 Ensure that adequate resources and personnel are budgeted and available as scheduled. Employees shall be cross-trained to perform critical LIMS functions. It is the responsibility of management to review training records to maintain awareness of the current status of training received and needed, observe job performance to determine the performance levels of the staff and possible needs for additional training, and examine project schedules and work backlogs to determine the adequacy of current staff and whether the LIMS is receiving proper staffing support.

8.1.4 Receive and evaluate reports of inspections of the LIMS and audits of the LIMS raw data and ensure that appropriate corrective actions are promptly taken in response to any noted deficiencies. All reports related to the LIMS should be reported to management in a timely manner. Management should sign and date the report.

8.1.5 Approve the standard operating procedures that establish the procedures to ensure data integrity, ensure that deviations from the established SOPs and applicable GALP provisions are appropriately documented and that corrective actions shall be taken when required and documented, and approve all changes to SOPs.

8.1.6 Assure that each applicable GALP provision is followed.

Controlled Document

8.2 Personnel Responsibilities LIMS

When LIMS data are collected, analyzed, processed, or maintained, it is the responsibility of Management to ensure that all LIMS support staff and users:

8.2.1 Have adequate education, training, and experience to perform assigned LIMS functions.

8.2.2 Have on site a current record of their training, experience, and job description, including related LIMS training.

8.2.3 Have sufficient number of trained employees for timely and proper operation of the LIMS.

8.3 Quality Assurance Responsibilities / LIMS

8.3.1 When LIMS data are collected, analyzed, processed or maintained, it is the responsibility of the LIMS Administrator and the QAO to monitor LIMS functions and procedures. This unit shall:

1) Be entirely separate from and independent of other LIMS users, and shall report directly to the Lab Director.
2) Have immediate access to LIMS data, SOPs, and other records pertaining to the operation and maintenance of the LIMS.
3) Inspect the LIMS at intervals not to exceed annually to ensure the integrity of the LIMS data. The result of this audit should be compiled into a report that includes the description of the LIMS operation inspected, the dates of the inspection, the person performing the inspection, all findings and any scheduled dates for re-inspection. In addition, any problems that might potentially affect data integrity must be reported to management.
4) Determine that no deviations from approved SOPs were made without authorization and sufficient documentation.
5) Perform, at minimum, quarterly audits of the LIMS raw data to ensure trace ability of measurements and data integrity.
6) Ensure that the responsibilities and procedures applicable to the Quality Department, the records maintained by the Quality Department, and the method of indexing such records are documented and are maintained.

Controlled Document

8.4 LIMS Raw Data

It is the responsibility of management to ensure that:

8.4.1 LIMS Raw Data and the storage media on which they reside are identified and documented. This documentation must be included in the laboratory's SOPs.

8.4.2 The individuals responsible for entering and recording raw data into the LIMS are uniquely identified when the data are recorded, by the security of the LIMS, which requires a valid login name and password. The times and dates of the operations are recorded in the LIMS.

8.4.3 When instruments directly transfer data to the LIMS, the instrument has a unique ID and records analysis date and time.

8.4.4 Procedures and practices to verify the accuracy of LIMS raw data are documented in the laboratory SOPs, and managed according to documented procedures.

8.4.5 Procedures and practices for changes to LIMS raw data are documented and tracked in the LIMS and provide the evidence of change, preserve the original recorded documentation, changes are dated, indicating the reason for the change, identify the person who made the change and if different, the person who made the change.

8.5 Software

When software is used to collect, analyze, process or maintain LIMS data, it is the responsibility of management to ensure that SOPs are established, approved, and managed for the following:

8.5.1 Development of methodologies that are based on the size and nature of software being developed.

8.5.2 Testing and quality assurance methods to ensure that all LIMS software accurately performs its intended functions, including:

1) Acceptance criteria, tests to be used, personnel responsible for conducting the tests, documentation of test results, and test review and approval.

2) Change control methods that include instructions for requesting, testing, approving, documenting, and implementing changes. When indicated,

Controlled Document

change control methods shall also include reporting and evaluating problems, as well as implementing corrective actions.

3) Version control methods that document the LIMS software version currently used.

4) Maintaining a historical file of software, software operating procedures (manuals), software changes, and software version numbers.

8.5.3 Documentation is established and maintained to demonstrate the validity of software used in the LIMS:

1) For existing and commercially available LIMS, minimum documentation shall include, but not be limited to: a description of the software and functional requirements; listing all algorithms and formulas, and as they occur, testing and quality assurance, installation and operation, maintenance/enhancement, and retirement.

2) For new LIMS development or modification of existing LIMS, documentation shall cover all phases of the generic software life cycle.

8.5.4 All documentation and records must be readily available where the software is used, and SOPs for the operations are readily available in the laboratory areas where the procedures are performed.

8.5.5 A historical file of software and the documentation specified in 8.5.2 are retained according to the procedures outlined in 8.9

8.6 Password Policy

8.6.1 Passwords are a very important aspect of computer security. Passwords are used for various computer and security related purposes. The most common uses are laboratory entrance, LIMS accounts, and email accounts. They are the frontline protection for all data generated by the laboratory. Poorly chosen passwords may result in the compromise of laboratory data and possibly the network.

8.6.2 Because of this, all employees are responsible for taking the appropriate steps to select and secure their passwords, using the guidelines established in SOP *Administrative Procedures DCN: 3025.*

8.6.2.1 All system level passwords (administration accounts) must be changed on a quarterly basis.

Controlled Document

8.6.2.2 All user-level passwords (e.g. email, web, desktop computer, etc.) must be changed every six months. This is the responsibility of the analyst to initiate. The System Manager will assist in this change.

8.6.2.3 Passwords must never be written down or inserted into email or any other forms of electronic communication.

8.6.2.4 If an account or password is suspected of being compromised, report the incident to the Lab Director, System Manager, or QAO to initiate password change.

8.7 Anti-Virus Policy

8.7.1 All networked PC-based lab computers with Internet connections have anti-virus software installed and are scheduled to run at regular intervals. The scheduled anti-virus software updates are performed by the network server and downloaded to each workstation automatically.

8.7.2 All computers suspected of being infected by a virus must be removed from the network until they are verified virus-free by IT support.

8.7.3 It is the responsibility of the System Manager and Lab Supervisors to ensure that the anti-virus software is run at regular intervals to keep the computers virus free.

8.7.4 Any activities with the intention to create and/or distribute malicious programs (Trojan horses, email bombs, viruses, worms, etc..) into the laboratory's network are prohibited.

8.8 Email Policy

8.8.1 Micro Methods Laboratory has established this policy with regard to the acceptable use of company provided electronic messaging systems, including but not limited to email and instant messaging. Email and instant messaging are important and sensitive business tools. This policy applies to any and all electronic messages composed, sent or received by any employee or by any person using company provided electronic messaging resources.

8.8.2 Micro Methods Laboratory sets forth the following policies, but reserves the right to change them at any time as may be appropriate or required under the circumstances:

- Micro Methods Laboratory provides electronic messaging resources to assist in conducting company business.
- All messages composed and/or sent using company provided electronic messaging resources must comply with company policies regarding acceptable communications.
- Micro Methods Laboratory prohibits discrimination based on age, race, gender, sexual orientation or religious or political beliefs. Use of electronic messaging

Controlled Document

resources to discriminate for any or all of the aforementioned reasons is prohibited.

- The electronic messaging system(s) is (are) company property. All messages stored in company provided electronic messaging system(s) or composed, sent or received by any employee are the property of Micro Methods Laboratory. Furthermore, all messages composed, sent or received by any person using company provided equipment are the property of Micro Methods Laboratory. Electronic messages are NOT the property of any employee.
- Upon termination or separation from the company, Micro Methods Laboratory will deny all access to electronic messaging resources, including the ability to download, forward, print or retrieve any message stored in the system, regardless of sender or recipient.
- Each employee will be assigned a unique email address that is to be used while conducting company business via email.
- Accessing external email systems from company provided equipment is discouraged. This includes, but is not limited to, Yahoo! Mail, Hotmail, MSN Mail, AOL, Earthlink and other email services offered by Internet service providers.
- Employees are prohibited from automatically forwarding electronic messages sent through company provided systems to external messaging systems.
- Micro Methods Laboratory reserves the right to intercept, monitor, review and/or disclose any and all messages composed, sent or received
- Micro Methods Laboratory reserves the right to alter, modify, re-route or block the delivery of messages as appropriate. This includes but is not limited to:
    - Rejecting, quarantining or removing the attachments and/or malicious code from messages that may pose a threat to company resources.
    - Discarding attachments, such as music, considered to be of little business value and of significant resource cost.
    - Rejecting or quarantining messages with suspicious content.
    - Rejecting or quarantining messages containing offensive language.
    - Re-routing messages with suspicious content to designated company employees for manual review.
    - Rejecting or quarantining messages determined to be unsolicited commercial email (spam).
    - Appending legal disclaimers to messages.
- Electronic messaging resources may be used *infrequently* and *occasionally* for personal use. Excessive personal use may result in disciplinary action, including but not limited to the loss of this privilege and/or termination. Company provided electronic messaging resources may not be used for the promotion or publication of one's political or religious views, the operation of a business or for any undertaking for personal gain.

Controlled Document

- Micro Methods Laboratory permits the use of instant messaging programs. The policies in this document apply equally to instant messages as well as email.
- Employees authorized to use instant messaging programs will be advised specifically on which instant message program(s) are permissible and which ones are not.
- Employees authorized to use instant messaging programs will be assigned a unique instant messaging identifier, also known as a buddy name, handle or nickname.
- Employees are prohibited from conducting employee business from any non-company provided email or instant messaging accounts.
- The unique email addresses and/or instant messaging identifiers assigned to an employee are the property of Micro Methods Laboratory. Employees may use these identifiers only while employed by the company. The right to use these identifiers terminates upon termination or separation from the company.
- Micro Methods Laboratory employs sophisticated anti-virus software. Employees are prohibited from disabling anti-virus software running on company provided computer equipment.
- Any employee who discovers a violation of these policies should immediately notify the Lab Director.
- Any employee in violation of these policies is subject to disciplinary action, including but not necessarily limited to, termination.

8.9 LIMS Security

8.9.1 Micro Methods makes every effort to maintain security of data within the LIMS. Security of the LIMS focuses on three security objectives:

1) Integrity

2) Availability

3) Confidentiality

8.9.2 Each user chooses a password for access that can be tracked throughout the system. Passwords are changed periodically, and every time there is suspicion of a breech in security. The master list of passwords for the LIMS is accessible only to the Lab Director, the LIMS administrator and the QAO. Users are required to log in, enter the data or perform their tasks, then log out of the system. Only the Lab Director, the LIMS administrator, and the QAO have super-user capabilities. Virus detection is performed frequently and updated at recommended intervals. Users are informed of the necessity and importance of confidentiality in the work place and out side the

Controlled Document

workplace. Only reputable and trusted technicians are used to service the system. Data Solutions & Networking Support, Inc. maintains the network.

8.9.3 The Lab supervisors are responsible for the security of their lab sections, and the lab's impact on the computer network. In the event that the Lab supervisor is unable to fulfill his/her duties, the lead analysts must assume this responsibility. Where security policies and procedures are not clearly defined, the lab supervisors must do their utmost to safeguard the laboratory from security vulnerabilities.

8.9.4 Data Solutions & Networking Support, Inc. provides network support. This organization has the responsibility of maintaining the firewall device (or software) between the corporate network and the Internet. The System Manager is responsible for maintaining the LIMS and instrument software and all lab computer hardware.

8.9.5 The System Manager, Lab Director, and QAO reserve the right to interrupt lab network connections that negatively impact data production or quality or pose a security threat or risk.

8.9.6 Data Solutions & Networking Support, Inc. maintains all IP addresses, routed within the network.

8.10 Hardware

When LIMS data are collected, analyzed, processed, or maintained, it is the responsibility of management to ensure that the LIMS hardware and communications components are:

8.10.1 Of adequate design and capacity, and a description is documented and maintained

8.10.2 Installed and operated in accordance with manufacturer's recommendations and, at installation, undergo acceptance testing that conforms to acceptance criteria established by the installer. SOPs shall be established and maintained to define the acceptance criteria, testing, documentation, and approval required for changes to LIMS hardware and communications components.

8.10.3 Adequately tested, inspected, and maintained to insure proper functioning. SOPs for and documentation of these routine operations shall be maintained. Documentation of non-routine maintenance shall also include a description of the problem, the corrective action, acceptance criteria, and the acceptance testing performed to ensure that the LIMS hardware and communications components have been adequately repaired.

8.10.4 In the event that hardware is upgraded the older hardware necessary to read older laboratory archived files be retained and maintained as part of the document retention process.

Controlled Document

8.11 Comprehensive Testing

When LIMS data are collected, analyzed, processed, or maintained, laboratory management shall ensure that comprehensive testing of LIMS performance is conducted, at least once every two years at minimum, whenever there are updates or modifications to the computer system or software. Tests shall be documented and available for audits of the system.

8.12 Record Retention

Management shall ensure that retention of LIMS data, documentation, and records pertaining to the LIMS are not less than ten years from the date of release of the report or document as required by LELAP. SOPs for retention must be documented, maintained, and managed as permanent record. If contract requirements are for longer periods of retention, these requirements shall be met.

8.13 Facilities

When LIMS data are collected, analyzed, processed, or maintained, it is the responsibility of management to ensure that:

8.13.1 The environmental conditions of the facility housing the LIMS are regulated to protect against LIMS data loss.

8.13.2 Environmentally adequate storage capability for retention of LIMS data, storage media, documentation, and records pertaining to the LIMS are provided.

8.14 Standard Operating Procedures for the LIMS Data

Laboratory management has the responsibility to ensure that:

8.14.1 SOPs include or address where applicable, the following topics:

1) LIMS raw data and storage media

2) LIMS raw data verification

3) LIMS raw data change control

Controlled Document

4) Software development methodologies (not applicable at this time)

5) Software testing and quality assurance

6) Software change control

7) Software version control

8) Software historical file

9) Hardware changes

10) Hardware testing, inspection, and maintenance

11) Records retention

SOPs are reviewed annually at minimum to ensure that they accurately reflect the current procedures.

SOPs are authorized by signature of approved signatories, in accordance with section 8.1.5.

A historical file of SOPs is maintained.

9.0 PLANNING

9.1 Customer Identification

9.1.1 Customer or client is defined as any individual or organization for which analytical services are furnished or work performed in response to defined requirements and expectations. Client and customers are acquired through solicitation for work through personal contact, advertisement, and client referrals.

9.2 Defining Customer Needs and Requirements

9.2.1 Direct communication between a Management Representative and the customer is required before any work is to be performed for the potential client. Assessment of the needs of the client, particular methods, QA/QC requirements, and information pertaining to quantity of samples, matrix types, hazards, methods, and turn around times shall be discussed. Clients often request specific methods be used. In the event that the laboratory is unable to perform the requested method, the client shall be

Controlled Document

notified prior to accepting samples. A request for an alternate method shall be made to the client.

9.2.2 Information shall be gathered to adequately identify the needs and expectations of the client in terms of both technical and quality goals. Direct communication with the client shall help to ensure a clear understanding of the client's needs and expectations, and the analytical services to be provided by the Laboratory.

9.2.3 All non-routine projects involving the acquisition of analytical data by the Laboratory shall be planned using the Guidance in EPA QA/G-4 Guidance for the Data Quality Objectives Process. Non-routine projects shall be documented in a Quality Assurance Project Plan from EPA QA/R-5, EPA Requirements for Quality Assurance Project Plans for Environmental Operations.

9.2.4 The Lab Director and the QAO shall approve all plans.

9.2.5 Management shall be responsible for assigning the most qualified staff to the projects undertaken.

9.2.6 Routine planning tasks, planning requirements shall be documented in the form of work plans, schedules and QAPPs. Specific work or project instructions shall be documented.

9.2.7 When the client does not specify the method to be used or where methods are employed that are not required, the methods used shall be available to the client and other recipients of the relevant reports.

9.2.8 The laboratory shall select appropriate methods that have been published either in international, regional or national standards, or by reputable technical organizations, or in relevant scientific texts or journals, or as specified by the manufacturer of the equipment when the client does not request a specific method of analysis. The final report contains the reference method used.

9.2.9 The laboratory rarely accepts R&D projects, specializing in environmental analyses. In the event that a client requests an analysis for which there is no published method available, the methods adopted by the laboratory shall be used only if they are appropriate for the intended use and if they have been validated by the laboratory. The client must agree in writing to the use of any method developed for the client or whenever an unpublished method is used. The laboratory shall be responsible for

Controlled Document

performing the method according to the developed procedure. The client shall assume the responsibility and liabilities of the use of the procedure.

9.2.10 If the client requests a method that is not appropriate for the parameter or is out-of-date, the Lab Supervisor shall contact the client to discuss options.

9.2.11 When selecting a method for use the following shall be considered in evaluating the method for the intended use and relevance to the client's needs:

9.2.11.1.1 The uncertainty of the results, detection limit, selectivity of the method, linearity, limit of repeatability and/or reproducibility, robustness against external influences and/or cross-sensitivity against interference from the matrix of the sample/test object.

9.2.12 In those cases where a well-recognized test method specifies limits to the values of the major sources of uncertainty of measurement and specifies the form of presentation of calculated results, the laboratory is considered to have satisfied this clause by following the test method and reporting instructions.

9.3 Introducing New Methods/Lab Developed Methods for Laboratory Use

9.3.1 Introduction of new methods, new instrumentation, or laboratory-developed methods shall be carefully planned. The process shall include input from the Lab Director, Lab Supervisors, Safety Officer, and the QAO. This input shall include information related to marketing, environmental controls (temperature, humidity, power, segregation, etc...), instrumentation, personnel and training, calculations, quality requirements, LIMS functions, reagents and chemicals, demonstrations of capability, safety issues, preventive maintenance, log book and worksheet development, validation, and any other relevant issues.

9.3.2 New method development, new instrumentation operation, and deviations from the reference method shall be the responsibility of the Lab Director and Lab Supervisors or their designees. Standard Operating Procedures shall be developed at the earliest opportunity. Operator's manuals and reference methods may be used until the SOPs are completed and issued for use.

9.3.3 All new methods development and new instrumentation shall only be assigned to qualified personnel. In the event that standard methods are used outside their intended scope, or the method or SOP is the laboratory shall document the deviation and shall make an effort to confirm that the methods are fit for the intended use. In the absence of time to adequately validate the modification of the procedure appropriate quality control indicators shall accompany the data.

Controlled Document

9.3.4 Management shall be responsible for providing adequate resources both monetary and support during implementation.

9.3.5 Implementation plans shall be updated as development progresses. The Lab Director shall approve all updates.

9.3.6 All new methods shall be appropriately validated prior to being issued for use unless waived in writing by the client. The validation shall be as extensive as is necessary to meet the needs of the given application or field of application. The minimum validation shall meet the initial test method evaluation requirements in NELAC Standards Appendix C.3 of Chapter 5.

Controlled Document

9.4 Producing the Desired Data Deliverable

9.4.1 From the information gathered from the client, research shall be done to translate the client's data needs into specifications to produce the desired data deliverable.

9.4.2 The work plan, schedules, and QAPPs shall be submitted to the client for approval, along with cost estimates for analytical services provided by the Laboratory.

9.5 Quality System and Technical Activities Coordination

9.5.1 Communication shall be established between the person assigned by Management to direct the project or analytical services and the technical staff. The Project Director shall communicate to the technical staff the details of the plan or process. The steps of implementing the plan of analytical services shall be discussed in staff meetings. Written instructions shall be used exclusively as hardcopy for project instructions. The Project Director is responsible for communicating to the technical staff such that all personnel understand their roles and responsibilities in the analytical process. Communication shall continue for the duration of the project or as needed.

9.5.2 Documentation for validation of implementation of sampling and analytical efforts shall be extensive. All aspects of the project or analytical process shall be documented. Implementation of the work process shall rely on documentation included in QAPPs, work plans, schedules, routine laboratory sampling logs, instrument logs, and calibration data. Further documentation shall be provided in SOPs.

9.5.3 Information deemed relevant to specific projects that would ensure an accurate and complete paper trail of the project or analytical service shall be documented. All organizational and project documentation supporting the project shall be distributed as established in the Project Plan or the SOPs.

9.5.4 Hazards associated with the analytical process shall be addressed. A qualified Safety Instructor shall do specific Safety Training. Medical concerns shall be addressed. Compliance with all known health and safety requirements is mandatory. Laboratory activities fall under the Chemical Hygiene Plan for the Laboratory.

Controlled Document

9.6 Work Sequence

9.6.1 All work is carried out in proper sequence and accordance with approved planning documentation that includes SOPs, QAPPs, Quality Assurance Manual, and other written authorized documentation.

9.6.2 Deviations from any initial work plan must be in writing and approved and authorized by the Project Director and the QAO.

9.7 Defining the Level of Quality Control

9.7.1 Quality control levels for specific projects shall be determined by applying the principles from EPA QA/G-4, *Guidance for the Data Quality Objectives Process.*

9.7.2 For analytical work, the quality controls mandated in the analytical methods shall be met or exceeded (Refer to QAM).

9.8 Contract Policy

9.8.1 Contracts for analytical services may be verbal or written, where appropriate. All written contracts or agreements shall include the client's specifications, procedures, and data requirements and the purpose of the analytical services requested, where applicable.

9.8.2 All contracts entered into shall have been reviewed by the Lab Director or designees to ensure that the client's data requirements, levels of detection, reference method requirements, time requirements, reporting requirements are adequately defined, documented, and understood.

9.8.3 The Lab Director or designees shall not accept/commence work until a readiness review has been conducted to determine if the laboratory has the capability to perform the requested work.

Controlled Document

10.0 IMPLEMENTATION OF WORK PROCESSES

10.1 Implementation of Work Plans and QAPPs

10.1.1 Responsibility of implementation of any project or work plan, including routine analytical testing and sampling, fall upon the Project Director, the Lab Director, the Lab Supervisors, and the QAO. Their responsibilities include the following:

1) Organization of projects and analytical work.
2) Planning the activities designed to meet the quality and sensitivity requirements.
3) Coordinating work performance evaluations.
4) Training and qualifying personnel to achieve and maintain proficiency.
5) Ensuring that the work is performed in accordance with the plan, method, or SOP.
6) Verify that all equipment (including back-up instrumentation), trained personnel, and reference materials necessary to complete the work or project is on-site, in working order, and available as needed for the project or work.

10.1.2 Management oversight for specific projects, as well as routine laboratory workings, shall be commensurate with the project or analytical testing required and shall be based on the intended use of the data product.

10.2 Work Implementation Process

10.2.1 Work for any specific project shall be done according to written instructions; i.e., QAPP, SOPs, and Job Work Orders, decided upon by a Project Director, supporting technical staff, and QAO. SOPs shall be written and maintained describing the tasks, methods, and procedures to be implemented.

10.2.2 The Project Director and staff shall write schedules.

10.2.3 The client or Micro-Methods' Field Technicians under the direction of the Project Director shall do sampling. Sample collection shall be done and documented as stated in written instructions of SOPs. Deviations from the initial work plans or SOPs must be in writing approved and authorized for use by the Project Director and the QAO. Sample tracking, measurement trace ability, and any pertinent information

Controlled Document

shall be documented and retained. Qualified technicians with adequate supervision, using written, authorized SOPs or work instructions, shall analyze samples.

10.2.4 Quality control indicators shall be used as a check of performance. Analytical raw data shall be reduced to a reportable format by the technician, reviewed by a peer or supervisor, reviewed by the Office Manager, reviewed by the QAO and finally the Lab Director before release only to the client.

10.2.5 Inspection, the use of analytical QC samples, and other means relevant and commensurate with the nature and importance of the activity shall monitor work performance to ensure satisfactory performance.

10.2.6 Work performance shall be considered to be satisfactory based on the following:

1) Completeness
2) Comparability
3) In control analytical measurement systems
4) Statistically valid measurements

10.3 Controlling Planned Procedures

10.3.1 Controlling the release, change and use of planned procedures is the responsibility of Management or their designees, such as the Project Manager or QAO. All planned procedures shall be reviewed and authorized by a Management Representative, by the Project Director, and by the QAO prior to release for general use. All planning documents and schedules are controlled to protect the confidential and proprietary rights of the client.

10.3.2 Project Directors or the Lab Director shall have oversight of the specific project or the analytical testing and shall closely monitor the data and operations as work progresses following schedules and goals. When changes to the plan are required, a Technical Document Change Notice Form must be initiated. This document can be initiated by a competent employee involved in the project, but must be approved by the Project Director, Lab Director, or QAO. Direct contact with the client may be necessary for approval, if the change affects the data quality objectives. For routine work instructions and SOPs, review shall take place whenever necessary because of revisions to methods, instrument replacement or upgrade, procedure or policy change, or any change in the activity. At minimum all procedures, plans, or manuals shall be reviewed annually by the Lab Director and designees and QAI. Changes to documents shall require that a Technical Document Change Notice be released with

Controlled Document

the changed document to be distributed to the proper personnel or those affected by the change.

10.3.3 It is the responsibility of QAO or designee to remove obsolete documentation from general use. Masters of obsolete documents shall be retained by QAO in a permanent controlled file for such documents.

10.4 Development of Operating Procedures

10.4.1 Standard Operating Procedures shall be written and followed for all routine, standardized or special/critical operations that affect the analytical data process or when clarification of a process or activity is required.

10.4.2 The format of the SOPs shall follow the guides established in EPA QA/G-6, *Guidance For The Preparation of Standard Operating Procedures (SOPs) For Quality Related Documents,* for Technical and Administrative SOPs where applicable or shall follow the NELAC proposed format for SOPs In all SOPs the requirements of NELAC shall take precedent over the format of the cited document.

10.4.3 Technical SOPs shall be written by Lab Supervisors and shall be reviewed and authorized for general use by the Lab Director, and the QAO,

10.4.4 Administrative SOPs shall be written by the Office Manager, Lab Director, or a Management Representative, then reviewed and authorized for general use by the Lab Director and QAO.

10.4.5 SOPs shall be reviewed at least annually, more frequently if changes are required, by the Lab Director, a Management Representative, and QAO. Lab Supervisors shall review technical SOPs and the Office Manager or Management Representative shall review administrative SOPs. Each SOP shall have a review and approval for use statement attached that indicates the date of the review, the approved signatories, and the issue date. This statement shall become permanent record along with the SOP. Changes to the SOP shall be documented in the Technical Document Change Notice form.

10.4.6 Changes shall include notification to those affected by the change.

Controlled Document

11.0 ASSESSMENTAND RESPONSE

11.1 Assessments

Assessments are evaluations intended to increase the user's understanding of the program or system being assessed, and to provide a basis for improving programs or systems.

11.1.1 Evaluations of the Quality System and its product shall be accomplished using assessment tools for environmental programs as discussed in this section.

11.1.2 Assessments shall include an evaluation of whether technical and procedural compliance is effectively met.

11.1.3 Assessments shall be performed according to written procedures by assessors chosen by Management with documented competence for the type of assessment performed.

11.1.4 Management is responsible for defining acceptance criteria, approving audit checklists, and identifying goals prior to the assessment.

11.1.5 Assessors shall be technically knowledgeable with no conflict of interest. Assessors from within the organization must have no involvement or responsibility for the work being assessed.

11.1.6 Assessors shall have complete authority to conduct the assessment activities and is authorized by Management to suspend or cease work in progress upon detection and identification of an immediate adverse condition affecting the quality of results or the safety of personnel.

11.1.7 Assessors, accrediting bodies, or regulatory agencies are authorized by Management to access programs and managers, access to documents and records, and the organization freedom to:

1) Identify quality problems
2) Identify and cite practices that may be shared with others to improve the quality of operations
3) Propose recommendations for resolving quality problems

Controlled Document

4) Independently confirm ineffectiveness of solutions provide documented assurance to line management that, when problems are identified, further work is monitored until the problems are resolved.

11.1.8 Management shall determine the type of assessment required for an activity from the following general types:

1) **Management self-assessment (Management Review)**: the qualitative assessment of a particular program operation by those immediately responsible for overseeing and/or performing the work. This assessment addresses whether the prevailing policies and practices are adequate for ensuring that the type and quality of results needed are actually obtained. Management self-assessments are performed at least annually, usually in January or during or immediately following the discovery of any policy or work practice that needs change or re-evaluation. All Laboratory operations shall be assessed annually at a minimum.

2) **Management independent assessment**: the qualitative assessment of a particular program and/ or organization by someone other than the group performing the work. This assessment addresses whether the prevailing policies and practices are adequate for ensuring that the type and quality of results are actually obtained.

3) **Technical self-assessment (Technical Audit)**: the evaluation process used by those immediately responsible for overseeing and/or performing the work to measure performance or effectiveness of a technical system and its elements with respect to documented specifications and objectives. Such assessments shall include qualitative and quantitative evaluations. It is the responsibility of the Lab Supervisors to schedule all technical audits.

4) **Technical independent assessment**: the evaluation process used by someone other than the group performing the work to measure the performance or effectiveness of a technical system and its elements with respect to documented specifications and objectives. Such assessments shall include peer reviews and audits.

Controlled Document

11.2 Management Systems Reviews (MSRs)

11.2.1 Management assessments shall be conducted annually by the Management Committee, comprised of the Senior Management Staff (President and Vice-President or CEOs), the QAO, the Lab Director, the Lab Supervisors, and selected staff. Senior Management shall document the adequacy of the framework and infrastructure of the Quality System and ensure its effective implementation.

11.2.2 Management Assessments shall assess the effectiveness of the quality system using audit checklists based on the requirements established from ISO/IEC Guide 25-1990, *General Requirements for the Competence of Calibration and Testing Laboratories,* or following the most current NELAC checklists.

11.2.3 Changes to the Quality System must be documented and implemented in an expedient manner.

11.2.4 The Management Committee shall at a minimum, annually review the Quality System to evaluate its effectiveness. Changes to the system shall be identified and initiated to meet current and future quality needs. Information gathered from internal and external audits, input and feedback from the Technical Staff, Clients, and changes in technology shall be the basis for system change decisions. Topics for the annual Management meetings shall include the following and documented on the Management Review Topics form DCN 098:

1) Suitability of policies (Quality System, Data Quality Objectives)
2) Effectiveness (Quality System, DQ Objectives)
3) Future changes to improve quality of service
4) Management/Supervisory reports
5) Recent Audit findings
6) External Audit findings
7) Results of Internal comparisons or Proficiency Testing
8) Changes in volume and type of work
9) Client feedback
10) Corrective Action
11) Other relevant factors

11.3 Surveillance

11.3.1 Surveillance is the act of monitoring or observing a process or activity to verify conformance to specified requirements. The Lab Director, Lab Supervisors, and

Controlled Document

QAO shall monitor the processes, technicians, raw data, and other Laboratory and Field activities to ensure that procedures are followed. Documentation shall be done to describe these activities

11.4 Laboratory Audits

11.4.1 Audits shall be performed in all areas of operation that affect the quality and output of data.

11.4.2 Audits shall be from internal and external sources.

11.4.3 Assessments shall be planned, and conducted annually and more frequently for specific areas that may need attention. A verification of the assessments will be reported by the supervisors to the Lab Director and QAO on the annual managerial review.

11.4.4 It is the responsibility of Management and designees to plan, schedule, and implement assessment procedures. The QAO is responsible for auditing the Quality System including the QAM and quality related SOPs at a minimum of annually. It is the responsibility of the Lab Supervisors to audit the technical procedures and processes based on the most current SOPs or Reference Methods.

11.4.5 It is the responsibility of the Lab Director and Supervisors for overseeing and scheduling assessments and for responding to the findings and decisions of the auditing team.

11.4.6 Scheduling of audits and allocation of resources for assessment activities shall be based on the status, risk, and complexity of the sampling and analytical testing. It is the responsibility of the QAO, the Lab Director, and the Lab Supervisors to determine that each element of the analytical process is functioning appropriately and within the guidelines of the proper methodology, the approved procedures. Deficiencies are documented and addressed to correct, improve and modify the system. Audits are conducted in response to unacceptable or questionable sample data and are a review and evaluation of the various components of the measurement and sample collection procedures to determine their proper selection and use.

11.4.7 Micro-Methods submit to on-site audits from federal, state and other regulatory or certifying agency. Clients who wish to audit the facilities may do so with prior notification and scheduling.

Controlled Document

11.4.8 Micro Methods Laboratory is in the National Environmental Laboratory Accreditation Program (NELAP). The accrediting body is LELAP (Louisiana Environmental Laboratory Accreditation Program and LDEQ #01960). Micro Methods Laboratory is required to submit to an on site audit by a representative from the accrediting body every two years at a minimum to maintain accreditation status. In addition to the on site audit, the representative performs an off-site evaluation of the laboratory quality documentation including selected SOPs and the Quality Assurance Manual. The laboratory must respond to all deficiencies uncovered during the audit within 30 days of notification with a plan to correct the deficiencies. All corrective action must be completed within six months following approval of the plan by LELAP. All items in NELAC Chapter 5 are available for the NELAP/LELAP auditor's off-site review, on-site inspection, and/or data audit.

11.4.9 The most recent NELAP/LELAP Accreditation certificate is posted in the foyer hallway. It is the responsibility of the QAO to ensure that the most recent and valid certificate is posted.

11.4.10 All statements concerning NELAP/LELAP accreditation of testing and accreditation status shall be accurate, clear, and precise so as to not mislead or imply endorsement by the accrediting body.

11.4.11 Micro Methods Laboratory shall use at least the phrase "NELAP accredited" and the laboratory's accreditation number or other identifier when the accrediting authority's name is used on general literature such as catalogs, advertising, business solicitations, proposals, quotations, laboratory analytical reports or other materials.

11.5 Performance Evaluations

11.5.1 Participation in relevant performance evaluations is required for many programs for which the laboratory performs testing. The Laboratory participates in the following Performance Evaluation Programs:

1) APG Performance Evaluation Testing Water Pollution (semi-annually)
2) APG Performance Evaluation Testing Water Study (annually)
3) AIHA Proficiency Analytical Testing (semi-annually)
4) APG DMR-QA (annually)

11.5.2 The QAO and the Lab Director shall evaluate technical staff internally using QC samples. The results of these indicators shall be compared to control limits established in the analytical methods or generated by Laboratory data.

Controlled Document

11.6 Data Quality Audits

11.6.1 Data Quality Audits shall be conducted by all Supervisory Personnel or designees and by QAO.

11.6.2 Data Quality shall be ensured by management overview and audits throughout the process of data collection, data entry, data reduction, data entry, reporting, and evaluation.

11.6.3 Data shall be monitored for errors, discrepancies, and statistical validity with documentation.

11.6.4 Reports requiring Level III or Level IV requirements are reviewed according to *SOP Data Quality Audits Level III / Level IV* DCN: 3029.

11.6.5 It is the responsibility of the QAO or designees to randomly select final reports for data quality audits. Approximately 5% of all final reports generated are audited.

The following data quality checklist is used for routine data quality audits:

11.7 Peer Reviews and Technical Reviews

11.7.1 Multiple QA and QC checks are performed at all phases of field and laboratory work to prevent and/or detect data quality problems.

11.7.2 Data (both raw and final) is to be evaluated by no less than two competent individuals. 100 percent of all raw data is checked by the individual performing the analysis or by a peer. The data is then annotated and directed to the appropriate Lab Supervisor or the Lab Director, whose responsibility is to check calculations, compare raw data to results, check for transcription errors, and determine compliance with method requirements and project specifications. Manual calculations are performed to confirm the analyst's calculations and to also confirm any electronic data system calculations. Any errors detected shall be investigated, corrected and documented.

11.7.3 The data is then forwarded to the Office Manager or designees, who assemble and print the report. The Office Manager or designee shall check for entry errors, and then forward the report to the QAO. The QAO or designees shall review and validate the data produced by the laboratory to ensure its validity, reliability, and defensibility. Checklists shall be used to review and document pertinent aspects of the data.

11.7.4 Review by QAO shall consist of comparing quality control Indicators to project or method control limits, for precision, accuracy, and completeness as it relates to data quality.

11.7.5 Reports summarizing errors detected during the quality review are routed to the Lab Supervisor for corrective action. Following acceptable corrective action, the data is again submitted to theQAO for completion of the quality review. QAO shall accept the changes, if satisfactory, annotate the data, and then forward the data to the Lab Director for final review.

11.7.6 The Lab Director verifies that the data product is consistent with project and analytical requirements and shall verify data sensibility. When the data is deemed acceptable for the client's requirements, the Lab Director shall authorize the release of the report to only the client.

11.7.7 Narratives are written noting any problems or anomalies encountered in the analytical process. Data is flagged where required.

Controlled Document

11.7.8 Peer review by a competent analyst is encouraged as an essential component of the system because problems are often identified quickly and corrective action implemented. Peer reviews shall be performed by fellow analysts (exchange of work between the analysts for checking purposes). Peer review leads to the development of a better data product.

11.7.9 Technical reviews shall be accomplished by one or more qualified reviewers (ex. Lab Supervisors or the Lab Director, independent of those who performed the work, but are equivalent in technical expertise to those who performed the original work. These reviews are an in-depth analysis and evaluation of documents, activities, material, data or items that require technical verification or validation for applicability, correctness, adequacy, completeness, and assurance that project and analytical requirements are satisfied. Documentation shall be accomplished through checklists and narratives.

11.8 Readiness Reviews

11.8.1 Readiness reviews are systematic, documented evaluations of the readiness for the startup or continued use of a facility, equipment, process, or activity (capability review). Readiness reviews shall be conducted prior to commencement of new projects, new methods, or new procedures. Readiness reviews shall follow narrative or checklist documentation. Readiness reviews for technical activities are the responsibility of the Lab Supervisors. Readiness reviews for Quality related activities are the responsibility of the QAO. Readiness reviews for Administrative activities are the responsibility of Management.

11.8.2 Readiness review leading to a contract for services (verbal or written) shall include evaluation of the laboratory operations to determine that the laboratory has the resources and capability to meet the requirements of the client. The review shall also determine that the appropriate environmental test method is selected and capable of meeting the clients' requirements and intended use. The review shall also include options for subcontracting work in the event that an analysis is requested that Micro Methods Laboratory cannot perform.

11.8.3 The Laboratory Director or Lab Supervisors shall discuss options for any work subcontracted with the client prior to accepting work.

11.8.4 The QAO shall discuss any accreditation or certification status questions with the client prior to accepting work, where accreditation is a requirement.

11.8.5 The Laboratory Director shall inform the client of the results of the review of capability if it indicates any potential conflict, deficiency, lack of appropriate accreditation status, or inability on the laboratory's part to complete the client's work prior to accepting any work.

Controlled Document

11.8.6 The Lab Director shall make every effort to resolve all differences prior to contracting with the client, such that the contract or request for services is agreeable to both parties (the client and the laboratory).

11.8.7 All records, documentation, checklists, memos, pertinent discussion topics, etc...Related to the contractual agreement shall be maintained with the contract as permanent record.

11.8.8 In the event that a deviation from the contract occurs or is detected, the Laboratory Director or Lab Supervisors shall promptly notify the client.

11.8.9 If a contract requires amendment after initiation of the work, the same contract review process shall be repeated and any amendments communicated to all affected personnel.

11.8.10 The Laboratory Director shall notify the client by phone, followed by hard copy of any suspension of accreditation, revocation of accreditation, or voluntary withdrawal of accreditation that may have an impact on any on-going projects or future projects.

11.9 Complaint Resolution

11.9.1 Complaint Resolution Responsibility

1) The Lab Director has the primary responsibility of initiating complaint resolution procedures or delegating authority to others to complete the tasks to the satisfaction of the client. All complaints must be promptly investigated or audited.

2) Delegation of authority for complaint resolution is at the Lab Director's discretion. In the event that the Lab Director is unable to handle the complaint, in financial complaints or business complaints the Office Manager shall assume complaint resolution authority. In complaints regarding data quality, the QAO shall assume complaint resolution authority. In matters related to results or technical operations, the lab supervisors shall assume complaint resolution authority.

11.9.2 Handling Minor Complaints

1) It is the responsibility of the Office Manager, the Lab Director, the Lab Supervisors, or the QAO to determine if the complaint is serious or minor.

2) Minor Complaints do not need to be logged into the Serious Complaint Log but they must be treated and acted upon immediately.

Controlled Document

3) Documentation of the changes shall be recorded according to SOP Error Corrections DCN 134.

11.9.3 Handling Serious Complaints

1) When a complaint is received from someone other than the Lab Director that is considered to be serious, the individual shall issue a Complaint Resolution Form, and immediately give it to the Lab Director. If the Lab Director receives the complaint call, he shall initiate the form. The Complaint # on the form shall be in the form XXXXXX-Y, where the first 6 Xs are the month, day, and year of complaint initiation. The Y is an ascending number beginning with "1" followed by consecutive numbers for each complaint registered on that day.

2) The Lab Director shall assign someone to resolve the complaint as soon as possible. The assignee shall complete the CRF and return it to the Lab Director for follow-up.

3) After follow-up, and the complaint is considered closed the CRF shall be given to the QAO for filing and maintenance.

4) The QAO is currently setting up a statistical program to monitor complaint data, so it is necessary to complete all information on the form.

11.9.4 Initiating Complaint Resolution

1) Client complaints are usually first handled by the Laboratory Director or his designee. Information is gathered from the complaint concerning Sample Date and Time received, Sample ID#, Report Lab File # and reason for the complaint. This information is then used to locate filed reports, raw data in bench log books and the technician who performed the analysis. If results are questioned this information can be used to check data calculations or located stored samples for re-checks.
The first step is to examine the raw data and the worksheets, looking for obvious mistakes (transposing numbers, poor peak integration, calibration problems, etc.) Do not assume that a mistake could not have occurred because the computer performed the calculation. If no calculation error or obvious analyst error if found, examine the pertinent quality control data. Was the system in control, as revealed by control charts or quality control indicators? Had there been any maintenance activities performed on the instrument prior to or following the analysis? Had the instrument been properly calibrated prior to the analysis? Had any quality assurance irregularities been reported at the time the analysis was performed?

Controlled Document

2) Thoroughly research the complaint in search of a legitimate cause for the erroneous result. After all the information is gathered the Lab Director or designee shall discuss a plan for resolving the complaint. If a reason for the non-conformance can be determined immediately notify the client of the details, and rerun the sample at no charge to the client, if holding time allows. All documentation shall be recorded in bound notebooks, Complaint Resolution Forms, or on the nonconformance forms, corrective action forms, and recorded in the corrective action master log.

3) Send a letter to the client if needed stating the problem, how it was corrected, and what shall be done in the future to avoid recurrence of the same problem. Thank them for their patience while the problem is being resolved and of course apologize.

4) In some instances the client may need to be educated to the fact that no measurement is completely error free and may need introduction to the concept of the confidence range. It may be that the confidence range of the disputed result includes the value the client thought he / she should have gotten.

5) If no error has been found and the examiner is confident of the validity of the result, and the expected result is outside the 95 percent confident range of the actual result, an offer can be made to rerun the sample with the following proviso. If the second result is within the 95 percent range of the first, the client shall pay for the second analysis. If not, the laboratory shall absorb the cost.

11.9.5 Resolving the Complaint

1) The plan to resolve the complaint shall be carried out to the client's satisfaction, the client shall be notified and a summary of the client's final comments recorded on the Complaint Resolution Form.

2) The completed form shall be given to the Lab Director. The Lab Director shall review the CFR and determine if the complaint is resolved based on the following guides:
   A) All of the facts and information has been compiled relating to the complaint. This shall include information from the client, from the raw data and completed report files, from the Lab Director and the individual most directly involved.
   B) A plan has been formulated to resolve the complaint, and action has been taken to correct the problems relating to the complaint.
   C) The client has been informed of the conclusions reached and steps in the resolution, and the client's response recorded. (Always focus on the client's data requirements)

Controlled Document

D) All forms documenting the resolution steps have been completed and signed by the Lab Director. The forms shall be filed and logged into the computer by the QAO or designee/s.

11.9.6 File Copies

1) The Lab Director shall maintain three ring binder containing un-resolved and resolved complaints.

2) Un-resolved or on-going complaints shall be moved to the resolved section as they are completed.

3) Un-resolved complaints shall receive priority treatment until they are resolved.

4) Un-resolved complaints that have long-term resolutions shall be discussed at staff meetings.

Lab Director Date

11.10 Data Quality Assessments

11.10.1 Environmental data shall be qualified according to the intended use of the data. Data must meet the qualifications set forth in this Manual, the analytical procedures, and those required by the data user.

11.10.2 When project specific data assessment is required, the EPA document *Guidance for Data Quality Assessment*, EPA QA/G-9 shall be followed.

11.11 Response to Assessment Findings

11.11.1 Management shall respond positively to the findings and recommendations from assessments in a timely manner. If a time for response is agreed upon, the laboratory shall make every effort to respond within this time.

11.11.2 The appropriate response shall be made promptly to conditions needing corrective action.

11.11.3 The Supervisors or designees shall implement and document the corrective action and subsequent follow-up action to confirm the effectiveness of the response action.

11.11.4 All audit and review findings and any corrective actions that arise from them shall be documented. The Management Committee shall review and discuss the findings at weekly or monthly meetings and shall ensure that these actions are discharged in a timely manner.

11.11.5 After corrective actions have been implemented and prior to the next audit of the area or laboratory operation, the auditor shall review the previous audit and verify that the corrective actions are in place and functioning properly and the issue resolved.

Controlled Document

12.0 QUALITY IMPROVEMENT

12.1 Responsibility

12.1.1 Management is ultimately responsible for identifying, planning, implementing and evaluation of the effectiveness of quality improvement activities. This is accomplished through the Management Committee guidance of the laboratory staff in quality improvement activities associated with monitoring plan development, data collection and storage, statistical analyses, quality control criteria, data interpretation, and report generation.

12.1.2 Staff at all levels are encouraged to identify customers' and suppliers' needs and requirements, identify process improvement opportunities, identify problems, and offer solutions to those problems.

12.1.3 Staff shall be educated and made aware of, through periodic motivational lectures by Management on the effects of poor job performance on other employees, customer satisfaction, and costs. The advantages of proper job performance at all levels shall be discussed. Management shall offer incentives to encourage staff and managers to exceed the expectations of the client whenever possible as a quality improvement goal. Staff shall be educated such that they have a clear understanding of the tasks that they are expected to perform and how those tasks support the overall mission of the laboratory.

12.2 Problem Prevention and Minimization

12.2.1 Precautions shall be taken to minimize and prevent problems from occurring. Planning, sampling, analysis, project management, and data handling procedures shall be continually monitored as required and applicable to ensure minimal errors and problems.

12.2.2 Quality Control Indicators shall be used as an aid to detection of problems in data quality and system performance.

12.2.3 Problems shall be assigned to the most qualified personnel for the problem area, who shall investigate, research, document, and then formulate a plan of corrective action to be reviewed and approved by a representative of the Management Committee.

Controlled Document

12.2.4 The Management Committee shall at least annually review existing overall laboratory performance and identify opportunities for quality improvement.

12.2.5 Technical Systems performance shall be monitored more frequently, as required for optimum performance. (Daily QC checks, Instrument Performance checks, etc.).

12.2.6 Following all audits, internal or external, and all performance evaluations, internal or external, technical and personnel performance shall be reviewed.

12.2.7 Problem prevention shall be a primary concern and shall be a pro-active process to identify opportunities for improvement rather than a reaction to the identification of problems or complaints.

12.3 Problem Prevention Tools

12.3.1 SOPs shall be used exclusively for analytical operations and activities. They shall be used as training guides for certifications. All authorized SOPs shall be available for use. SOPs shall be followed as guides that shall be the foundation of the data product. SOPs shall be controlled and revised when necessary to improve data quality.

12.3.2 Personnel training shall be extensive, comprehensive, and continuous in nature.

12.3.3 Quality control samples shall be entered as routine control indicators. In addition, blind samples shall be introduced into the analytical system to monitor performance of the system and personnel. Quality control indicators (surrogates, blank samples, matrix duplicates, matrix spikes, and matrix spike duplicates) shall be used to monitor operations and procedures. Periodic inspections of instrumentation and equipment shall be as required.

12.3.4 Documentation of the implementation process shall be to the extent possible to provide defensible, accurate data, as well as established a paper trail for future reference.

12.3.5 Documentation of the qualifications and activities of all technical personnel activities (sampling and analytical) shall also support and describe the work for future reference.

12.3.6 Specific planning, sampling, analytical, and program management activities that do not meet established requirements (i.e., deficiencies, non-conformances) shall be identified, controlled, documented, reported, and corrected. Plans shall be developed,

Controlled Document

implemented and monitored in such a way to reduce the likelihood of the occurrence of such non-conformances and to take advantage of the opportunities for improvement.

13.0 SAMPLING PROCEDURES

13.1 General Sampling Procedures

13.1.1 The objective of sampling is to collect a portion of material small enough in volume to be transported conveniently and handled in the laboratory while still accurately representing the material being sampled. This objective implies that the relative proportions or concentrations of all pertinent components shall be the same in the samples as in the material being sampled, and that the sample shall be handled in such a way that no significant changes in composition occur before the tests begin. In many instances the objective of sampling is to demonstrate compliance with specific regulatory requirements. Samples are presented to the laboratory for specific determinations with the sample collector taking responsibility for the validity of the sample. Because of the increasing importance of the ability to verify the accuracy and representativeness of data, greater emphasis is placed on proper sample collection and preservation techniques.

13.1.2 Micro-Methods often conducts or prescribes the sampling procedures or protocols based on the Methods employed or as a result of the data users' needs, but always in consultation with the user of the test results. Written sampling plans can be designed to meet clients' requirements. Such consultation is essential to insure selection of a sampling plan and analytical methods that provide a true basis for answering the questions that prompted the sampling. A carefully designed and documented sampling plan is necessary to provide reliable samples. The plan shall address the type and number of samples, the details of collection and the procedures followed. For the purpose of planning, samples have been divided into the following four sample types:

1) ***Representative*** - A sample is considered to be typical of the universe of concern and whose composition can be used to characterize the universe with respect to the parameter measured.

2) ***Systematic*** - A sample taken according to a systematic plan, with the objective of investigating systematic variability of the universe of concern. Systematic effects due to time or temperature are typical matters of concern.

Controlled Document

3) ***Random*** - A sample selected by a random process to eliminate questions of bias in selection and/or to provide a basis for statistical interpretation of measurement data.

4) ***Composite*** - A sample composed of two or more increments that are combined to reduce the number of samples needed of average compositional variability.

13.1.3 Three kinds of sampling plans can be used in a measurement process based on the above types of samples.

1) ***Intuitive*** - Plans based on the judgment of the sampler

2) ***Statistical*** - Plans based on statistical sampling of the universe of concern providing the basis for probabilistic conclusions

3) ***Protocol*** - Plans based on stated sampling procedures; data to be used for decision-making purposes

13.1.4 Each type of plan has advantages and disadvantages. Micro-Methods shall develop sampling plans based on the client's needs and requirements recognizing that sampling is one of the most critical steps in chemical measurement. All aspects of sampling, sample preparation, and sub-sampling shall be done according to an approved plan or method. Properly recorded documentation shall support that these plans were followed. Management must approve any deviations in writing. Standard Operating Procedures cover routine sampling procedures using various sampling equipment. If no procedure exists to guide in a sampling project, a plan shall be designed and documented. The plan shall be written as a protocol, including any relevant Standard Operating Procedures needed to be followed. The plan shall address at a minimum, the following:

1) When, where, and how to collect samples (initial site evaluation required if possible)

2) Sampling equipment to be used, including its maintenance and calibration

3) Sample containers, including cleaning, addition of stabilizers, and storage

4) Criteria for acceptance and/or rejection of samples

Controlled Document

5) Criteria for exclusion of foreign objects

6) Sample treatment procedures such a drying, mixing, and handling prior to measurements

7) Sub-sampling procedures

8) Sample record keeping such as labeling, recording, and auxiliary information

9) Chain of custody requirements

13.1.5 More extensive plans can be developed depending on the client's needs.

13.2 General Sampling Precautions

13.2.1 The goal of the sampler is to obtain a sample that meets the requirements of the sampling program and handle it so that it does not deteriorate or become contaminated before it reaches the laboratory. Micro-Methods management shall coordinate sampling procedures with field technicians to assure that samples are collected as outlined by the sampling plan or in accordance with Method requirements (examples, SW-846, NIOSH) for sampling and preservation. All field personnel shall discuss directly with the Lab Supervisors or their designee when a question arises pertaining to a sampling procedure. Samples must be collected and handled such that they produce data representative of the area of concern. In order to do this, both field and laboratory personnel must perform their activities in accordance to approved methods and procedures. The following documentation is to be used as a general guide to eliminate many of the inconsistencies encountered in the sampling process.

13.2.2 All deviations, additions or exclusions from the documented sampling procedure shall be recorded in detail and these documents maintained along with the appropriate sampling data. The data shall have an associated qualifier with an explanation of the deviation in the narrative. It is the responsibility of the Lab Director or Lab Supervisors to notify all affected personnel including the client if necessary.

13.3 Sample Bottle Preparation

13.3.1 The sampling team (Project Manager and field technicians) must consider the analyses to be performed and are responsible for making certain that the proper sample containers and shipping containers are assembled. The

Controlled Document

preservatives are added to the sampling containers under laboratory conditions, unless instructed otherwise. Sample bottles are pre-cleaned according to EPA protocol by the bottle supplier (various sources I-Chem., Quorpak, QEC, Wheaton) with certification of cleanness. The certifications, lot numbers, and bottle preparation documentation are retained on file. Custody seals and Chain of Custody documents are provided to aid in sample integrity. Trip blanks, field blanks, blank spikes, extra bottles for field duplicates and laboratory Quality Control are provided when required or requested.

13.3.2 Sample containers and preservation techniques must be consistent with the EPA recommendations set forth in the Methods being employed.

13.4 Field Records

13.4.1 The sample collection team, keeping clearly legible notes of problems or unusual occurrences encountered, must complete all records relating to field collection. The collection team shall record in bound 8 ½ x 11-inch notebooks (pre-printed lab notebooks supplied by Scientific Bindery Productions) the following information, if available:

1) Location of sampling point

2) Name and address of field contact

3) Producer of waste and address if different from location

4) Type of process producing waste

5) Type of waste (e.g., sludge, wastewater)

6) Suspected waste composition

7) Number and volume of sample taken

8) Purpose of sampling

9) Description of sampling point and sampling methodology

10) Date and time of collection

Controlled Document

11) Collector's sample identification information

12) Sample distribution and how transported

13) References of the sampling site (maps, photographs)

14) Field observations

15) Any field measurements made

16) Signatures of personnel responsible for observations

13.4.2 It is recognized that sampling situations vary widely. No general rule can be given as to the extent of information that must be entered into the logbook. A good rule, however, is to record sufficient information so that anyone can reconstruct the sampling without reliance on the collector's memory. The logbooks shall be safely maintained and stored as permanent records. All field records must be recorded in indelible ink.

13.5 Field Sample Identification

13.5.1 The field personnel are responsible for correctly identifying and labeling each sample collected. Samples must be uniquely labeled, as they are collected with the following information, as a minimum:

1) Project Number (if available)

2) Sample identification information

3) Location of Sample Point

4) Sample Date and Time

5) Sampler/Samplers

6) Preservation or Stabilizers Added

Controlled Document

13.5.2 For most sample containers pre-printed labels are available on which the above information can be written.

13.6 General Field Sample Collection Guidelines

13.6.1 Samples must be collected using an approved sampling plan utilizing techniques consistent with the parameter to be measured. The following documentation gives general sampling techniques and procedures for routine sampling schemes. Sampling Plans and/or Standard Operating Procedures shall give more specific information if needed.

13.7 General Safety Precautions

13.7.1 Safety must always be the primary consideration in the collection of samples in the field. A thorough understanding of the waste production process, chemical spill area, or any area suspected of contamination and potential hazards associated with the area must be investigated prior to any initiation of any sampling. The field personnel in a bound laboratory notebook must record any information pertinent to safety. The site must be visually evaluated just prior to sampling to determine if any additional safety measures need to be taken. Minimum protection of gloves and safety glasses must be worn to prevent sample contact with the skin and eyes. A respirator must be worn even when working outdoors if organic vapors are known to be present. Protective clothing shall be worn when required. More hazardous sampling missions may require the use of supplied air and special clothing. Only technicians trained to sample in these situations shall be allowed to do these types of sampling plans.

13.8 Volatile Organics Sample Collection

13.8.1 Water

13.8.1 Standard 40ml glass screw cap VOA vials with Teflon-lined silicone septa may be used for liquid matrices according to SW-846, Chapter 4, and "Organic Analysis." Micro-Methods use 40 ml amber glass, pre-cleaned to EPA specifications for Superfund sample analysis with certificates of analysis, which are retained on file. The vials are prepared in the laboratory by added HCL to bring the pH of the sample to less than 2 or HCL can be added in the field to accomplish the pH requirement. The sample must be introduced into the vials gently to reduce agitation, which might drive off volatile compounds. In general, liquid samples must be poured into the vial without introducing any air bubbles within the vial as it is being filled.

Controlled Document

13.8.1.1 Should bubbling occur as a result of violent pouring, the sample must be poured out and the vial refilled. The vials must be completely filled at the time of sampling, so that when the septum cap is fitted and sealed, and the vial inverted, no headspace is visible. The sample vials must be hermetically sealed and must not be opened prior to analysis to preserve sample integrity. A signed and dated custody seal (sampler's responsibility) shall be placed on each vial collected. At least two VOA vials are filled per sampling point and labeled immediately at the point at which the sample is collected. The two vials from each sampling location sampling shall be then sealed in plastic bags, to prevent cross contamination, placed in coolers containing sufficient amounts of ice or ice packs to maintain sample temperature at 4 degrees C +/- 2 degrees C. Sample information must be recorded in a bound field notebook and Chain of Custody forms must be initiated and completed as each sample is collected.

13.8.1.2 If a sample is to be collected for volatile analysis which may contain residual chlorine use the following guidelines: Collect the sample in a 125-ml pre-cleaned container which has been pre-preserved with 4 drops of 10% sodium thiosulfate solution. Gently swirl to mix sample and transfer to 40 ml amber, pre-cleaned vials. Cool to 4 degrees C, and then adjust to pH less than 2 with HCL.

13.8.1.3 VOA vials must never be filled near a running motor or any type of exhaust system. Due to differing solubility and diffusion properties of gases in liquid matrices at different temperatures, it is possible for the sample to generate some headspace during storage. This headspace shall appear in the form of micro bubbles but shall not invalidate a sample for volatiles analysis unless the bubble size is greater than 5mm in diameter. However, the presence of a macro bubble in a sample vial generally indicates either improper sampling technique or a source of gas evolution within the sample. The latter case is usually accompanied by a buildup of pressure within the vial. Unpublished studies conducted by the USEPA indicate that pea-sized bubbles did not adversely affect volatiles data. Avoid storing highly contaminated samples in the same area that low-level samples are stored or shipped. If samples are suspected to be highly contaminated, activated carbon should be added to the plastic sample bags to control possible cross-contamination.

13.8.1.4 VOA samples may also be contaminated by diffusion of volatile organics the septum during shipment and storage. To monitor possible contamination, a trip blank prepared from organic free reagent water must be carried throughout the sampling, storage, and shipping process.

Controlled Document

13.9 Soil/Sludge/Sediment/Solid Waste

13.9.1 VOA vials for samples with solid or semi-solid matrices must be filled according to the guidance given in the appropriate method for sample introduction to be used. Standard Operating Procedures have been written which contain the appropriate collection techniques and amounts needed. Table 5.4.2C contains the EPA guidelines in use for collection of Soil, Sediment, Ash, or Sludge. Solid samples are collected using pre-cleaned (with level of cleanness certified) 125 ml or 4 oz. wide-mouth glass containers. Teflon-lined tops are required. The containers must be filled as completely as possible.

1) Eliminate as much free air space as possible by tapping the container slightly. No preservatives are added to solid or semi-solid samples. Samples must be placed in sealed plastic bags. Adherence to all contamination precautions required. Adherence to all documentation and labeling requirements as previously stated must be followed. Adherence to sample temperature requirements must be followed and documented.

13.10 Sample Collection for Semi-Volatiles, Pesticides/PCBs, and Herbicides)

13.10.1 Water

13.10.1.1 Samples shall be collected using pre-cleaned, (with certified level of cleanness suitable for trace analysis) one liter, and amber glass, Boston Rounds, with Teflon lined lids. Sample bottles shall be rinsed three times with the sample (if enough sample exists to do this), and then discarded and a fresh sample shall be collected. Sample bottles shall be filled to the neck, capped and a custody seal placed on the top. Adherence to all contamination precautions required. Adherence to all documentation and labeling requirements as previously stated. Adherence to sample temperature requirements to be followed and documented (cool to 4 degrees C).

13.10.1.2 If a water sample is known to contain residual chlorine, add 3-mls of 10% sodium thiosulfate per gallon. Cool to 4 degrees C.

13.11 Solid Samples

Controlled Document

13.11.1 Collect Solid/Sludge/Soils/Ash samples in certified, pre-cleaned 250 ml wide-mouth glass containers with Teflon lids. Cool to 4 degrees C.

13.11.2 All sample collection volumes, container type and size, preservative requirements, and holding time requirements as stated in Table 5.4.2C must be used for samples analyzed by SW-846 Methods for Organics. Documentation of sample bottle preparation shall be recorded in either bound lab notebooks or on pre-printed bench sheets. Standard Operating Procedures exist for general sampling techniques using proper equipment. Included are some statistical formulas for determining sampling schemes, Quality Control requirements, and other information necessary to properly perform tasks of field sampling (SOP *Sampling Procedures*).

13.12 General Wet Chemistry

13.12.1 Samples collected for general wet chemistry analyses shall follow the requirements set forth by Standard Methods for sample amounts, container type, and preservation. All documentation requirements shall be followed.

13.13 NIOSH Methods

13.13.1 Samples to be analyzed by NIOSH methods (air, filters, and bubblers) shall follow the appropriate requirements found in the method to be used.

13.14 Drinking Water Samples

13.14.1 Samples to be analyzed by Drinking Water Methods (500 series) shall follow the requirements stated in Table 5.2.5.2A for container sample amount, container type, preservation, and holding times.

13.15 Inorganic Analyses

13.15.1 Samples to be analyzed for inorganic constituents shall follow the appropriate guidelines found in the relevant tables, methods, or SOPs.

Controlled Document

13.16 Sample Transport

13.16.1 Prompt transfer of the sample to the laboratory is mandatory. Field personnel must notify the lab of the number of samples being shipped, number of coolers used, the method of transport (field personnel transport, UPS, Fed Ex or other means), the estimated time of arrival of the samples to the lab and any other pertinent information, documenting this information in the field notebook. Each cooler must be checked to verify that the sample containers are consistent with the chain of custody information. The samples must be properly packaged to prevent breakage. Adequate ice must be added to meet the temperature requirements. "Blue Ice" packs should be avoided because they do not cool as well as ice does. The Chain of Custody records, field records and analysis request forms must be sealed in plastic and taped to the inside of the cooler lid or be sent as an individual package. The cooler must be sealed with heavy strapping tape or duct tape. Custody seals, when required, shall be placed on the coolers.

14.0 SAMPLE CUSTODY

14.1 Custody

14.1.1 For the purposes of defensibility, it is necessary to have an accurate written record to trace the possession of samples from collection through disposal. The procedures defined in this section represent the means to satisfy this requirement.

14.1.2 A sample is in someone's "custody" if:

1) It is in one's actual physical possession

2) It is in one's view, after being in one's physical possession

3) It is in one's physical possession and then locked up so no one can tamper with it

4) It is kept in a secured area, restricted to authorized personnel only

Controlled Document

14.1.3 The sample collector is required to initiate the chain of custody form. All required information must be submitted. Chain of Custody forms must be started in the field, and sample information entered as the samples are collected (refer to SOP *Sample Custody and Documentation*).

14.1.4 After accepting custody of the sample or documentation the responsible person must be prepared to testify that the sample or documentation was in their possession and view or secured in the laboratory at all times from the moment it was received from the custodian until the time that the analyses are completed or the sample is disposed.

14.2 Transfer of Custody and Shipment

14.2.1 When transferring the possession of samples the transferee must sign and record the date and time of sample custody exchange on the chain of custody record. Custody transfer, if made to a sample custodian in the field, must account for each individual sample, although samples may be transferred as a group. Every person who takes custody must fill in the appropriate section of the chain of custody.

14.2.2 The field custodian (or field sampler if a custodian has not been assigned) is responsible for properly packaging and dispatching the samples to the laboratory for analysis. This responsibility includes filling out, dating and signing the appropriate portion of the chain of custody record.

14.2.3 The chain of custody record and other pertinent forms or documentation must accompany all packages sent to the laboratory. The field sample custodian shall keep copies of the chain of custody record.

14.2.4 Mailed packages can be registered with return receipt requested. If packages are sent by common carrier, shipping receipts must be retained as permanent documentation.

14.2.5 If samples are shipped by mail or by other common carrier, the shipper must comply with any applicable Department of Transportation regulations. Most water samples are exempt unless quantities of preservatives used are greater than certain levels. The package must be sealed or locked to prevent tampering. Any evidence of tampering should be readily detected if adequate sealing devices are used.

14.2.6 If the field sampler delivers samples to the laboratory, custody may be relinquished to the sample custodian or his designee only. Until sample log in the samples must

Controlled Document

be stored in the cooler (original transportation coolers) unopened, in the walk-in cooler in the rear of the laboratory. The person delivering the samples for the laboratory must make a logbook entry stating where and how the samples were delivered and secured and relinquish the samples to the lab sample custodian by signing the chain of custody in the appropriate box.

14.3 Laboratory Sample Control Procedures

14.3.1 Sample control procedures are necessary in laboratory from the time of sample receipt to the time the sample is discarded. The following procedures are implemented to maintain the integrity of the sample while in custody by the laboratory.

14.3.2 Management has established the position of sample custodian and an alternate custodian to assume the duties of the primary custodian in the custodian's absence. All incoming samples must be received by the custodian, who must indicate receipt by signing the accompanying custody/control forms and who is responsible for attaching the chain of custody to the lab bench sheets, which shall become permanent record. The custodian is responsible for logging into the LIMS all samples received, and generating sample labels and bench worksheets.

14.3.3 The custodian maintains a permanent logbook to record, for each sample, the person delivering the sample, the person receiving the sample, date and time received, source of sample, date the sample was taken, sample identification log number, how transmitted to the laboratory, and condition received (sealed, unsealed, broken container, preserved or not, iced or not, or any other pertinent remarks). This log shall also document movement within the lab; i.e., who removed the sample from the custody area, when it was removed, when it was returned, and when it was disposed. The LIMS has sample tracking and technicians are required to document the program.

14.3.4 The custodian maintains a permanent logbook to record, for each sample, the person delivering the sample, the person receiving the sample, date and time received, source of sample, date the sample was taken, sample identification log number, how transmitted to the laboratory, and condition received (sealed, unsealed, broken container, preserved or not, iced or not, or any other pertinent remarks). This log shall also document movement within the lab; i.e., who removed the sample from the custody area, when it was removed, when it was returned, and when it was disposed.

Controlled Document

The LIMS has sample tracking and technicians are required to document the program.

14.3.5 The sample custody area is locked at all times with the sample custodian and lab supervisors retaining keys to the area.

14.3.6 The custodian must ensure that heat and light sensitive samples or other sample materials having unusual characteristics, or requiring special handling, are properly stored and maintained prior to analyses.

14.3.7 The custodian, documenting the sample movement, shall make distribution of samples to the lab analysts or supervisors.

14.3.8 The laboratory work area is maintained as a secured area, restricted to authorized personnel only. The lab supervisors or management when entering the lab secured area must accompany visitors.

14.3.9 Laboratory personnel are responsible for the care and custody of the sample once it is received by them and must be prepared to testify that the sample was in their possession and view or secured in the lab at all times from the moment it was received from the custodian until the time that the analyses are completed.

14.3.10 When samples are distributed to lab sections preparation is documented either in lab preparation worksheets or in lab notebooks.

14.3.11 Once the sample analyses are completed, the unused portion of the sample must be returned to the custodian. The returned, labeled sample must be retained in the designated custody area until permission is given to dispose. If the sample is completely used during the analysis it must be documented in the LIMS sample-tracking program.

14.3.12 Samples shall be disposed of only upon the order of the lab supervisor or lab director, who must first ascertain that the samples have exceeded the maximum holding time established by the regulating agencies or by the lab. Sample disposal documentation is required. The sample custodian and/or designees shall discard samples.

14.3.13 At least quarterly the sample custodian shall review the sample log to determine if sample control information is up-to-date. The records shall be reviewed for trace

Controlled Document

ability, completeness, and accuracy. The custodian shall report any inconsistencies to the QAO.

14.4 Sample Acceptance/Rejection Policy

14.4.1 Samples received by the laboratory for compliance purposes must be rejected unless they meet the following criteria:

a) proper sample container
b) adequate sample amount
c) preservatives as set forth by the methods employed
d) maximum holding times not exceeded

14.4.2 Sample collection and transport requirements strict adherence to correct sampling procedures, complete identification of the sample, and prompt transfer of the sample to the laboratory. When the lab is not responsible for sample collection or transport, it must verify that the paperwork, preservatives, containers, and holding times are correct or reject the sample. See SOP Sample Custody and Documentation for more detail.

14.5 Sample Refrigeration/Preservation

14.5.1 All samples requiring refrigeration as part of preservation shall be stored in locked coolers maintained at 4 degrees C +/- 2 degrees. The temperature shall be verified during regular work hours (Monday-Friday 8:00am-4:30pm) unless additional monitoring is required, and corrections made if needed. The responsible analyst documents the temperature readings. In case of cooler failure, samples shall be moved to a backup cooler or shall be iced until repairs are completed.

14.5.2 All samples shall be checked to verify that samples requiring chemical or thermal preservation have been properly handled. The sample custodian shall verify and document thermal preservation. The analysts shall verify chemical preservation, such as pH prior to the analysis of samples for volatile analysis shall be verified by the analyst following the aliquot being taken for analysis or after the analysis is complete whichever best protects the sample integrity. Documentation shall be recorded in the Log-In Form or bound notebook by the sample custodian or designee or in the lab notebook or bench sheet for the analysis.

14.6 Sample Disposal Non-Hazardous

14.6.1 After such time as has expired that the sample integrity can no longer be considered valid (one month following the maximum holding time), any remaining samples

Controlled Document

shall be moved to a general sample holding area to be stored for three to six months. (Times may vary depending upon available storage space.) Semi-volatile extracts shall be held for a minimum of six months. Extended storage times can be implemented if requested by the client or required by the regulating agency.

14.6.2 Following the extended storage time, the Lab Director or designee shall give permission to the sample custodian to dispose of the remaining samples. The sample custodian shall document that the samples have been disposed of properly in the sample-tracking log. The sample custodian is responsible for monitoring the length of time the samples are held in storage. The samples are disposed in several ways:

1) Samples are returned to the client.

2) Samples are deposited into proper waste containers to be handled by Commercial waste handlers (Waste Oil Company, BFI, or Southern Waste Services).

3) Samples are depleted during analysis.

14.6.3 It is the responsibility of the sample custodian to properly dispose of, record transfers, and contact clients regarding disposal. Laboratory/Sample waste is contained in the area designated as the waste holding area (locked building behind the Lab). Waste oil shall be separated from chlorinated solvent waste. Non-hazardous waste shall be separated from hazardous waste. All waste shall be stored in proper waste drums supplied by the waste handler. Entrance to the waste storage area is restricted to only those authorized by management. This area is to remain locked, except during inspections and waste transfers. Employees entering this area must wear appropriate safety equipment.

Controlled Document

14.7 Sample Disposal Hazardous

14.7.1 It is the policy of Micro-Methods to collect, store, package, label, ship and dispose of hazardous wastes in a manner which ensures compliance with all Federal, State and local laws, regulations, and ordinances. These procedures are also designed to minimize employee exposure to hazards associated with laboratory-generated hazardous wastes and to afford maximum environmental protection.

14.7.2 Policies and procedures for operation of the laboratory's environmental compliance program are detailed in Micro-Methods, Inc.'s, Chemical Hygiene Plan.

14.7.3 Micro-Methods is subject to the Resource Conservation and Recovery Act regulations, as contained in the Mississippi Rules for Hazardous Waste Management for the handling, storage, and disposal of laboratory-related hazardous wastes.

14.8 Hazardous Waste Determination

14.8.1 The determination for whether or not a waste is a regulated substance is made by applying the following criteria either individually or in combination based on the following criteria:

1) Is the waste material listed in 40 CFR 261.30 – 261.33?

2) Does the material conform to any of the listed characteristics specified in 40 CFR 261.20 – 261.24?

3) Does the generator have personal knowledge of the hazardous nature of the material?

4) Would disposal of the material as non-regulated waste pose an environmental threat and/or leave Micro-Methods or our clients open to future liabilities?

14.8.2 Waste, which meets any of the above criteria, must be handled and disposed of as regulated waste.

14.9 Sample Holding Times

14.9.1 Sample Holding Times begin with the date and time of the collection of the sample. Holding time for any analysis is defined as the "technical holding time" or actual age of the sample, that is, the amount of time that has lapsed between the time the

Controlled Document

sample was collected and the time the sample was analyzed or prepared for analysis. Some methods have holding times prior to sample prep and another period of time for analysis of the prepared solutions (e.g. BNAs, TCLP analyses).

14.9.2 It is the responsibility of the Sample Custodian, at log in to determine if the samples are received within the holding time requirement. In the event that a sample is submitted outside of the required holding time the Sample Custodian will contact the client regarding the anomaly to determine if re-sampling is possible or get authorization to proceed with the analysis. If the client authorizes the analysis, the Sample Custodian shall record the date and time of the authorization on the Sample Receipt form, the name of the person contacted. All data associated with the holding time violation must be qualified with an appropriate qualifier and discussed in the narrative report. Data with qualified results must not be used for compliance purposes and the client must be made aware of this.

14.9.3 In the event that a sample is received within the required holding time but in such a time that causes the sample to have to be analyzed or prepared immediately to avoid exceeding the holding time, the client may be charged additional fees to compensate for the rush status. For example, a client sends in a water sample for BNA analysis six days after collecting the sample, leaving the laboratory only one day to extract the sample, an additional "rush charge" may apply. It is the responsibility of the Sample Custodian to make the Lab Director or Lab Supervisors aware of this type situation and document this on the Sample Receipt Form.

14.9.4 It is the responsibility of the analysts and supervisors to monitor all holding time requirements once the sample has been logged in and received into the appropriate laboratory for analysis. This is accomplished using LIMS queries to extract the holding time information. To be most effective and minimize the holding violations the queries must be run frequently (once a day at minimum). In the event that an analyst detects a holding time violation, the analyst is responsible to notify the supervisor of the violation and initiate corrective action.

14.9.5 The Lab Supervisors must verify and document that all of the samples under their areas of responsibility were prepared and analyzed within the required holding time. In the event that holding time requirements are exceeded as a result of laboratory problems, the Lab Supervisor shall notify the client by phone as soon as possible to discuss re-sampling and reanalysis (the cost of this action is the burden of the laboratory). If re-sampling is not an option, the data must be qualified and discussed in the narrative and the analysis is charged at a fee rate acceptable to the client.

14.9.6 Below are the sample Container type, preservation, and holding time information:

Controlled Document

14.10 Sample Preservation, Holding Times, Container Type, and Amounts

Analysis	Method	Preservation			Holding Times			Container Type	Required Sample Amount

15.0 ANALYTICAL PROCEDURES

15.1 Use of Approved Methodology

15.1.1 All measurements shall be made using methodology appropriate for the specific purpose. The Lab Director shall evaluate each method and Supervisors to determine if this method is the most appropriate method for achieving the required results. All technicians shall be required to read the methods that they shall employ and must demonstrate proficiency in the method before being allowed to perform the analytical procedure. Only approved procedures and methods shall be used. All instructions, standards, manuals and reference data relevant to the work of the laboratory shall be kept up to date and made readily available to personnel.

15.1.2 It is the responsibility of the Lab Supervisors and Lab Director to approve all methods and procedures for use. They shall consist of EPA Methods, NIOSH Methods, Standard Methods for the Examination of Water and Wastewater, SW-846 Methods, ASTM procedures and other procedures consistent with NELAP/LELAP requirements.

15.1.3 The laboratory shall use appropriate methods and procedures for all environmental tests within its scope of accreditation. (These include sampling, handling, transport, storage and preparation of samples, and, where appropriate, an estimation of the measurement uncertainty as well as statistical techniques for analysis of environmental test data).

15.1.4 The Lab Supervisors are responsible for writing and maintaining instructions on the use and operation of all relevant equipment, and on the handling and preparation of samples where the absence of such instructions could jeopardize the results of environmental tests.

15.1.5 The following methods and procedures have been approved for use in this laboratory:

15.3 Analytical Methods/Standard Operating Procedures

15.3.1 The laboratory staff shall use appropriate test methods and procedures for all tests and related activities within its responsibility, which include sample collection, sample handling, transport and storage, sample preparation and sample analysis. The method of testing shall be consistent with the accuracy required and shall contain any standard specifications relevant to the calibrations or tests concerned. The laboratory staff shall have available to them and use EPA approved methods (examples EPA methods, SW-846 Methods), NIOSH methods, ASTM methods, and OSHA methods for the required testing and shall apply them as they are intended. For reporting to, or in states with regulating agencies, such as LAC, only methods approved by the regulating agency shall be used. Substitute methods shall not be used without the approval of the client or regulating agency. Non-validated methods shall not be used unless requested by the client or regulating agency in writing.

15.3.2

15.3.3 Deviations from methods approved by the regulating agency or department must be approved in writing by the regulating agency prior to the deviation. When approved methods or appropriate modification is not available, data must be accompanied by a validation package containing the following information:

15.3.4 origin of method

15.3.5 deviations from the standard

15.3.6 reason for the deviations

15.3.7 effects of the deviations

15.3.8 comparison with the regulating agency approved method that has been replaced with documentation which indicate that the results from the modified method are equal to or better than the original method

15.3.9 Any federal and or/state regulations, which apply to the request for an alternate method, shall have priority over LAC regulations, and shall be utilized in the assessment of the request.

15.3.10

15.3.11 All deviations shall be documented and validated according to NELAC 5.10.2.1 and Appendix C, which require a demonstration of capability, and shall be made available to the client and other recipients of the final reports. In house copies of Analytical Methods that are performed shall be kept current as they are issued. Copies may be paper, diskettes, or CDs. It is the responsibility of the Lab Director and Lab Supervisors to maintain the methods current. Methods shall be modified and adopted as Standard Operating Procedures.

15.3.12 The SOPs shall indicate the method was modified. Standard operating procedures (SOPs) describe the way specific operations and methods are to be performed. These include sampling operations, sample preparation, calibrations, measurement

Controlled Document

procedures, and any operation that is done on a repetitive basis. "Standard" means that it specifies the way the operation is done on each occasion, which may or may not be a procedure developed by a standards-writing organization. However, when such is available, (EPA approved Methods, i.e.,) preference is always given to using published standard methods when applicable.

15.3.13 In all SOPs the requirements of NELAC shall take precedent over the format of the cited document.

1) 15.3.7 All methods employed shall be converted to SOPs, as feasible, which shall contain the following information if known or available (from ASTM format or from *EPA-QA-G6*) and shall contain information to meet the requirements of NELAC:

2) Scope and Application
3) Summary of Method
4) Method Detection Limit/Reporting Limit
5) Definitions
6) Interferences
7) Health and Safety Warnings
8) Cautions
9) Personnel Qualifications
10) Equipment and Supplies
11) Reagents and Standards
12) Sample Collection, Preservation, Handling, & Storage
13) Calibration and Standardization
14) Procedure
15) Data Analysis and Calculations
16) Data and Records Management
17) Pollution Prevention/Waste Management
18) Quality Control/Quality Assurance
19) Corrective Actions
20) References
21) Tables, Diagrams, Flowcharts, and Validation Data

Controlled Document

15.3.8 Standard operating procedures shall be written for all methods, for all routine tasks, and when clarification of a matter relating to the routine operation of any laboratory procedure. SOPs shall be written by only the following: the Lab Supervisors, the QAO and the Lab Director. All SOPs must be evaluated by peers of the initiator, and approved by signature by the SOP generator, QAO and Management.

15.3.9 SOP manuals shall be evaluated at a minimum, annually, and approved by signature of lab supervisors, QAO and Management. All revisions must also be approved in likewise manner.

15.3.10 SOP manuals shall be kept in the labs in which they are to be used, available to all analysts.

15.3.11 Any procedure that has been revised must be edited in the computer, recording the revision number, issue date, revision date, and implementation date, with approval signatures. Copies shall be sent to those affected by the change. Current SOPs shall be maintained in ring binders or individually bound and outdated SOPs shall be kept on file.

15.3.12 It is the responsibility of the laboratory's supervisors to ensure that the essential standards outlined in NELAC Appendix D or mandated methods or regulations (whichever are more stringent) are incorporated into their method manuals.

15.4 Instrument Calibrations General Guidelines

15.4.1 Any equipment or methodology that is used to provide numerical data that can influence a measured value shall be calibrated to the accuracy requirements set forth in the methods or described in the Standard Operating Procedures for its use. Support equipment or instrumentation shall be calibrated annually at a minimum. Calibration data shall be retained as permanent record for a minimum of seven years or as required by the regulating body or client following the issuance of the final report. Records shall be stored in areas suitable for maintaining the integrity of such data. Calibration schedules are established for all aspects of physical and chemical measurements and shall be strictly observed.

15.4.2 Calibrations shall be performed using reference standards or support equipment used solely for calibrations (cannot be used for sample measurement).

15.4.3 Physical standards and measuring devices shall have currently valid calibrations, traceable to national standards or purchased certified solutions approved for use by EPA (A2LA, NIST) where available. All dilutions of standards shall be recorded in

Controlled Document

standard logbooks, with associated certification documentation being retained on file as permanent record for a minimum of seven years or as required by the regulating agency or client.

15.4.4 Corrections for impurities in neat standards shall be applied as required by the accuracy of the data.

15.4.5 Chemical calibrations and standardizations shall be made using standards prepared by methods and procedures reflecting state of the analytical art and materials of certified purity.

15.4.6 Calibrations standards obtained commercially must adhere to the requirements for standards, with suppliers certifying compliance. Vendors must provide evidence of the quality of the services and materials. Standards used in the initial and continuing calibration shall be traceable to a national standard, when available.

15.4.7 Standard curves shall be prepared to adequately cover the expected concentration ranges of the instrument and samples following Relative Standard Deviation or Calibration factor requirements and control requirements stated in the method or SOPs. The lowest standard shall correspond to the lowest quantitation level for which quantitative data are reported to the extent possible.

15.4.8 New standard curves shall be prepared whenever an out-of-control condition is indicated, following instrument maintenance that could affect the calibration, after new standards are prepared, following long periods of instrument inactivity, or when training personnel.

15.4.9 The acceptability for use or continued use of instrumentation shall be according to the needs of the analysis or application for which the equipment is being used.

15.4.10 To ensure that the data is of known quality and is appropriate for a given regulation or decision the essential elements that define the procedures and documentation for initial instrument calibration and continuing instrument calibration verification shall be followed. Whenever reference methods are combined into standard operating procedures (e.g. 624 and 8260) the more stringent criteria of the methods shall be used for acceptance criteria. When it is unclear which standard is more stringent, the requirements of the regulation or mandated test shall be method followed.

15.4.11 Unless mandated by the reference method, regulating agency, or program the initial calibration response factors or calibration factors shall be used for quantitation and the continuing calibration shall be used to verify the initial calibration.

Controlled Document

15.4.12 The details of the initial instrument calibration procedures including calculations, integrations, and acceptance criteria and associated statistics included shall be referenced in the test method SOP.

15.4.13 When initial instrument calibration procedures are referenced in the test method the referenced material documentation shall be retained by the laboratory for 7 years and available for review.

15.4.14 Sufficient raw data records shall be retained to permit reconstruction of the initial instrument calibration. Examples are: calibration date, test method, instrument, analysis date, each analyte name, analyst's initials or signature; concentration and response, calibration curve or response factor; or unique equation or coefficient used to reduce instrument responses to concentration.

15.4.15 To the extent possible all initial instrument calibrations shall be verified with a standard obtained from a second manufacturer or lot if the lot can be demonstrated from the manufacturer as prepared independently from other lots.

15.4.16 Criteria for the acceptance of an initial or continuing instrument calibration shall meet the requirements of the reference method, shall be referenced in the Standard Operating Procedure. (e.g., correlation coefficient or relative percent difference) and shall be appropriate for the calibration technique employed. The lowest standard corresponds to the lowest quantitation level for which quantitative data are reported.

15.4.17 Average Response Factors for 8000 series methods shall be calculated according to the method requirements and shall meet the method acceptance criteria. Calibration Factors for 8000 series methods shall be calculated according to the method requirements and shall meet the method acceptance criteria. If Linear Regression is used for 8000 series methods a minimum of 6 calibration points are used and the correlation coefficient must be equal to or greater than 0.99. If Linear Regression is used for other methods the correlation coefficient must be equal to or greater than 0.995. If Quadratic Regressions are used a minimum of 7 points are required and the correlation coefficient must be equal to or greater than 0.99.

15.4.18 Calibrations for various analytical methods are detailed below. Other calibrations are provided in methods SOPs or in SOP *Calibration and Frequency*.

Controlled Document

15.5 Laboratory Instrument Calibrations

15.5.1 Thermometers

15.5.1.1 Working thermometers shall be checked annually against an NIST traceable certified thermometer at two temperatures that bracket the working range of the thermometer and the results recorded and documented for each thermometer.

15.5.1.2 Thermometers shall be labeled when calibrated and the correction factor recorded on the label and on the calibration bench sheet.

15.5.2 Balance Calibration

15.5.2.1 Records of balance calibration shall be kept for two weight ranges using at minimum ASTM class 2 or class S reference weights (weights shall be certified at least every 2 years and are only used to verify balance calibrations). Records or equivalent showing daily or before each use, functional/calibration checks for pan balances shall be maintained. Each balance in use shall have a balance calibration check logbook for acceptance. Refer to Table below for an example of balance calibration acceptance checks.

BALANCE CALIBRATION CHECKS

ANALYTICAL BALANCE		*TOP LOADING BALANCE*	
CLASS S WEIGHT	**TOLERANCE**	**CLASS S WEIGHT**	**TOLERANCE**

1g	±0.0004g	5g	±0.05g
10g	±0.0005g	10g	±0.20g
50g	±0.0010g	50g	±0.20g
		100g	±0.20g

*These are representative of the range of weights typically used.

Controlled Document

15.5.3 Metals General Guidelines

15.5.3.1 Metals are analyzed by three method protocols:

200 series - NPDES and Drinking Water
6000 series - RCRA testing
7000 series - RCRA testing

Calibrations shall be performed as per the method requirements.

15.5.4 Atomic Absorption (GFAA and FLAA)

15.5.4.1 Atomic absorption spectrophotometers are calibrated daily with the method required number of calibration standards. A calibration blank is also included. The correlation coefficient of the regression curve must be equal to or greater than 0.995. Next and initial calibration verification (ICV) is analyzed immediately following the initial calibration and must meet the criteria in the table below. After each analytical batch of 10 continuing calibration verification is analyzed. The CCV must also meet the acceptance criteria in the Table below. Blanks are analyzed following each calibration verification and must meet the criteria in the Table below.

15.5.5 Inductively Coupled Plasma-Atomic Emission (ICP)

15.5.5.1 ICP calibration is performed daily using a single point calibration standard containing the target metals followed by a calibration blank. Multi-point calibrations followed by calibration blank are analyzed at a minimum of annually to use to plot a curve for linearity. Initial calibration verification standard is analyzed following the calibration and must meet the acceptance criteria in the Table below. A Continuing Calibration Verification standard is analyzed after every 10 samples and at the end and must meet the criteria specified in the Table below. Immediately following the calibration standards, a calibration blank is analyzed. A blank and LCS are analyzed with every analytical batch.

METALS

ICP (Inductively coupled plasma-atomic emission)

*Contains RL standard

15.5.6 General Laboratory Instrumentation—ION Chromatography (IC)

15.5.6.1 Initial calibration, following instrument startup, and when the continuing calibration fails the continuing calibration acceptance criteria. A calibration curve is established by analyzing the required number of standards. Linear regression or quadratic curve fitting is used depending on the response of the analyte. The correlation coefficient must be greater than or equal to 0.995 for each compound before the calibration can be used for quantitation. Calibration verification standard is analyzed immediately following the calibration, following every 10 samples and at the end for closure.

Controlled Document

15.5.7 Ultraviolet-Visible Spectrophotometer (UV-VIS)

15.5.7.1 Spectrophotometers are initially calibrated using a 5-point calibration at a minimum of every 6 months, following startup, or when continuing calibration verification is unacceptable. A calibration curve is generated. The correlation coefficient of the initial curve must be greater than or equal to 0.995 using a regression fit. The calibration curve is verified daily by analyzing a midpoint calibration standard. The verification standard must agree within +/- 10% of the concentration of the standard.

15.5.8 pH Meters

15.5.8.1 pH meters are calibrated daily with two standard buffers at pH 7.0 and either 4.0 or 10.0, and then checked against the buffer not used. The reading must be within + or – 0.10 pH unit of its value. Calibration verification standards are analyzed immediately after calibration and following every 10 samples. Temperature compensation is taken into account. When samples fall outside of the pH range of 4.0-10.0, the meter shall be calibrated using other buffers that bracket the pH range of the samples. Newer meters allow for calibration using three buffers and should be checked with all three.

15.5.9 Bomb Calorimeter

15.5.9.1 Benzoic acid tablets are used as standard controls at a minimum of quarterly and must be within 10% of the true value.

15.5.10 Support Equipment/Environmental Controls

15.5.10.1 Equipment such as ovens, water baths, hot plates, coolers, refrigerators, incubators, autoclaves, and concentrators are checked in the expected use range as required or before each use with thermometers traceable to NIST standards. Refrigerators, coolers, water baths, incubators and concentrators are checked daily (days of use) during regular working hours and the readings recorded. When testing requires stricter monitoring or testing during non-regular work hours, the support equipment shall be checked during the non-regular work hours or as required by the test.

Controlled Document

15.5.10.2 Autoclaves are monitored for temperature, cycle time, and pressure of each run of the autoclave by the use of appropriate chemical indicators or temperature recorders and pressure gauges and documented.

15.5.10.3 The facilities and lab areas used for environmental testing, including but not limited to energy sources, lighting and environmental conditions, are controlled and monitored such as to facilitate correct performance of the environmental tests. Micro Methods Laboratory makes every effort to ensure that the environmental conditions do not invalidate the results or adversely affect the required quality of any measurement.

15.5.10.4 To the extent possible, effective separation shall exist between neighboring areas in which there are incompatible activities including culture handling or incubation areas and volatile organic chemicals handling areas.

15.5.10.5 Potential for cross contamination is controlled through appropriate measures. Volatile samples are in sealed plastic bags. Volatile samples are segregated from all other samples. The Volatiles Lab is separated from the main lab. Holding blanks are analyzed weekly to monitor contamination within the laboratory. Trip blanks are analyzed with every sample delivery group. Preservatives are prepared frequently and are expiration dated. Sample containers are purchased pre-cleaned. Shipping containers are cleaned frequently. Most Semi-Volatile, Pesticide, and Herbicide samples are placed in sealed plastic bags. Custody seals are used. Samples are returned to their storage areas when testing is completed.

15.5.10.6 Access to the testing areas is controlled. Clients are encouraged to use secondary containment when submitting samples.

15.5.10.7 Whenever sampling or environmental testing is conducted at sites other than this facility, particular care is taken to control the environmental conditions and simulate laboratory conditions to the extent possible.

15.5.10.8 The analyst/technicians shall monitor, control and record environmental conditions to the extent possible, as required by the relevant specifications, methods and procedures or where they influence the quality of the results. Conditions that may impact the results of the sampling or testing such as biological sterility, dust, electromagnetic disturbances, radiation, humidity, electrical supply, temperature, and sound and vibration levels shall be monitored appropriately.

15.5.10.9 In the event that environmental conditions jeopardize the results of sampling or testing the event shall be immediately stopped until such time as the event can be resumed or re-started. The analyst/technician has the responsibility to assure that environmental conditions are monitored and shall notify their immediate Supervisor when work has been interrupted. The event shall be documented on the corrective action form.

15.5.10.10 In instances where monitoring or control of any environmental conditions are specified in a test method or by regulation, the analyst/technician shall not

Controlled Document

commence testing until all of the conditions are met and shall document adherence to the requirements on bench sheets, in appropriate log books, or forms.

15.5.11 Conductivity Meters

15.5.11.1 Internally standardized before using. The cell constant of conductivity meters is determined annually by analyzing KCL standards (5 levels) and verified daily using a check standard. Temperature compensation is applied.

15.5.12 Total Organic Carbon Analyzer (TOC)

15.5.12.1 TOC analyzers are calibrated according to the manufacturers' instructions, which is a minimum of a single point and immediate calibration verification. After every 10 samples a check standard is analyzed. Acceptance is less than or equal to 10% of the known value.

15.5.13 Dissolved Oxygen Meter

15.5.13.1 Dissolved Oxygen meters are calibrated prior to each use using the air calibration technique.

15.5.14 Gas Chromatography and Mass Spectrometry

15.5.14.1 Micro-Methods analyze volatile and semi-volatile organic compounds by GC using the 600 series (NPDES), and 8000 series (RCRA) methods. Both internal standard and external techniques are employed. Calibrations are further detailed in the methods SOPs and SOP *Calibration and Frequency*. Initial calibration is performed upon initial start-up of the instrument and whenever the continuing calibration verification fails acceptance criteria. Calibrations are prepared as required by the methods. Calibration curves are generated and the correlation coefficient must be greater than or equal to 0.99 for 8000 series when the calibration curve is used. Calibration factors are also used when external calibrations are performed. For internal standard calibrations average response factors are calculated for each analyte. The acceptance criteria for GC methods can be found in the Tables below. If the percent RSD of the calibration curve is less than or equal to the acceptance criteria the average response factor can be used. A mid-point calibration is analyzed to verify calibration. If the percent difference is less than or equal to the acceptance criteria, then calibration is acceptable for analysis.

Controlled Document

GC/GCMS CALIBRATION CRITERIA
VOLATILES & SEMI-VOLATILES by GC

Calibration Check Initial calibration- Minimum calibration Standards	500-series 3*	600-series 3	8000-series 5
% RSD criteria	≤20%	≤10%	≤20% (With exceptions Noted below)
CCV criteria (%Difference or %drift)	±20%	±15%	±15% (With exceptions Noted below)

*An alternate single point calibration can be performed if the standard response is within 20% of the sample response.

GCMS Calibration Criteria-Volatiles

VOLATILES by GC/MS		
METHOD	**INITIAL CALIBRATION CHECK CRITERIA**	**CONTINUING CALIBRATION CHECK CRITERIA**
624	All targets <35% RSD, or alternatively, Construct calibration curve	QC Check Sample (20µL) meets limits Specified in method-Table 5, Range for Q
8260	CCC <30%RSD; if %RSD<15%, the Average RF can be used for quantitation if the %RSD >15%, a calibration curve Must be constructed and used for quantitation. The correlation coefficient or coefficient of determination for the Curve must be greater than or equal to 0.995	CCC <20% difference or drift from Initial calibration
8260	SPCC (minimum RF) Chloromethane 0.10 1,1-Dichloroethane 0.10 Bromoform >0.10 Chlorobenzene 0.30 1,1,2,2-Tetrachloroethane 0.30 (0.10 for 25 mL purge)	
524.2	All targets <20% RSD, or alternatively, Generate linear, 2nd or 3rd order calibration Curve (2)	All targets <30% difference from initial Calibration, or alternatively, using analyst Judgment, all targets must fall on the

15.6 Standard Preparation

15.6.1 Neat chemical standards of purity documented to be greater than or equal to 97% are purchased from approved suppliers. In special cases when the purity of the neat compound is less than 97% and greater purity cannot be purchased, the standard will be corrected for the actual purity.

15.6.2 When stock solutions are available from approved suppliers, these will be purchased rather than purchasing neat standards and preparing the solutions in the laboratory. Second source verification where available will be used on standards prepared in the laboratory. These standards should be less than 10% difference.

15.6.3 The preparation of stock solutions, working standards, and calibration standards must be documented in an appropriate standards logbook. These custom logs are coil bound and are located in the Metals Lab, the Wet Lab, and Organics Lab. Standards log book entries must be initialed by the analyst and given a unique reference number:

15.6.4 Record all relevant information in the standards/reagents preparation log. See Attachments

15.6.5 Assign the standard/reagent a unique reference number. For purchased calibration standards use the manufacturer's name for the standard and add the date of the preparation.

15.6.6 Daily Standards and Working Standards (e.g. Volatiles Continuing Calibration Verification standards) must have a unique reference number, must be recorded in the appropriate log book, and the reference number associated with the samples, either by recording the reference number in the run log or in the data analysis information in the analytical software.

15.6.7 Label the standard container with pre-printed labels. Complete the required information on the labels. See Attachment

15.6.8 Calibration Standards must only be weighed on the Mettler AT261 Delta Range analytical balance. Large volume reagents must be weighed on the Sauter RC 4021only in the Wet lab. .

15.6.9 All purchased reagents and solvents must be labeled (by Sample Custodian and/or Analyst) upon receipt with the following information: (See Attachment)

- 15.6.9.1 Date received:
- 15.6.9.2 Date opened:
- 15.6.9.3 Opened by:
- 15.6.9.4 Expiration Date:

15.6.10 Expiration dates for neat, dry, inorganic chemicals and standards and aqueous acids must not exceed 5 years from the date of receipt unless stability data is validated (usually not cost effective). Expiration dates for organic solvents or

Controlled Document

aqueous solutions must not exceed one year from the date of receipt or preparation. Expiration dates for some solutions or chemicals may be much shorter that the guides above. Consult the method, manufacturer's recommendations or MSDSs for expiration information.

15.6.11 Volatile standards, solutions, or reagents that are expected to degrade must be labeled with an adjusted expiration date base on the date opened.

15.6.12 If the standard or reagent container is too small to contain all of the required information (on the label) the vial can be labeled with one reference number and placed into a larger container with all of the necessary information including the reference number.

15.6.13 All reagents, standards, and solvents must be stored appropriately in the designated areas. In addition, the chemicals should(not required) be labeled with a short hand notation for storage conditions:

15.6.13.1 A = Ambient
15.6.13.2 R = Refrigerate
15.6.13.3 F = Freeze

15.6.14 Reagent purity and stability should be demonstrated by assaying the reagent before and after the study. When documentation from the manufacturer exists that the reagent was assayed this documentation must be retained.

15.7 Preparation of Standards from Neat High Purity Stock Material

15.7.1 When an analytical reference standard cannot be obtained from an approved vendor, the use of neat standards must be approved by the lab supervisor. When purchasing neat standards, obtain the highest purity possible. When standards are less than 97% pure, document in the standards book why a higher purity could not be obtained (e.g. Not Available).

15.7.2 The chemical standards shall be kept sealed and refrigerated when not being used in the preparation of standard solutions. Store according to manufacturer's recommendations to minimize standard degradation.

15.7.3 A vendor or supplier can sometimes misrepresent compound purity. When purchasing standards, analytical documentation must accompany the standard assuring the purity of the compound. Purity confirmation documentation should use at least two of the following:

15.7.3.1 GC/FID analysis,
15.7.3.2 HPLC analysis,
15.7.3.3 Infrared spectrometry
15.7.3.4 Differential Scanning Calorimeter
15.7.3.5 Other appropriate techniques

Controlled Document

15.7.4 The following correction factor for impurity when weighing neat materials in the standard preparation process is as follows:

$$\text{Weight of impure compound} = \frac{\text{Weight of pure compound}}{\text{(percent purity / 100)}}$$

Where weight of the pure compound is that required to prepare a specific volume of a standard solution at a specific concentration

15.7.5 Weights of compounds assayed to be less than 97% pure must be corrected when calculating the concentration.

15.7.6 Retain all analytical documentation assuring that all compounds used in the preparation of standard solutions are correctly identified. Misidentification of compounds occurs occasionally, either from the supplier, vendor, or during analysis. Make every effort to ensure that the standards being used are correct in quantity and quality. Identification confirmation, when performed shall be GCMS using two different columns. This information must be retained with the purity documentation.

15.7.7 Check the balance accuracy using a minimum of two weights once every 12 hours. The balance must be capable of accurate weights to the nearest 0.1 mg. Peer verification is required. Documentation of acceptability is initials of the peer. When preparing calibration standards or reagents, calculate the weight of the material for the volume of solution required, corrected for purity. All calculations are subject to peer verification, and documented as correct by initials of the peer.

15.7.8 Dilution solvents must be compatible with the procedure in which the standard will be used. The neat material must be soluble, stable, and non-reactive with the solvent. Solutions of multi-component must not react with each other. When possible, use acetone or methanol for surrogate standard and spiking solution mixes, methylene chloride and acetone for BNA calibration standards, hexane for pesticides/PCBs and ether or MTBE for Herbicide standards.

15.7.9 Weigh solid standards directly on to a folded weighing paper. Transfer the weighed material into an appropriate volumetric flask containing about 75% of the desired solvent volume. Mix well to dissolve. Sonication or warming may be required to adequately dissolve the material.

15.7.10 Dilute to the specified volume.

15.7.11 Record all weights and subsequent dilutions in the appropriate logbooks. Peer verification is required and must be documented by peer initials.

Controlled Document

15.7.12 Label each standard with the identity, the unique standard ID code, the concentration, preparation date, the solvent, the expiration date, any storage information, and preparer's initials.

15.8 Purchase of Standard Solutions

15.8.1 Most standard solutions used in the laboratory are purchased from approved vendors and meet the following criteria with documentation supplied by the vendor or supplier:

15.8.1.1 Have documentation to ensure mass spectral identification confirmation of the solution,

15.8.1.2 Have documentation ascertaining the purity of the solution

15.8.1.3 Have chromatographic and quantitative documentation checking the standard concentration according to the following:

The quality of reference standards purchased in solution shall be demonstrated statistically and analytically by a method of the supplier's choice meeting the requirements in Section 7 of Exhibit E SOM01.x of CLP SOW.

15.9 Documentation of the Verification and Preparation of Chemical Standards

15.9.1 It is the laboratory's responsibility to retain and maintain documentation as assurance that the standards, solvents, and reagents conform to the following:

15.9.1.1 All log books, calculations, chromatograms, mass spectral data, etc., produced either by the supplier, vendor or laboratory, shall be retained and maintained by the laboratory, subject to on-site review of laboratory operations by external audit sources. All data related to the standards preparation and verification must be retained and maintained for a period of 7years.

15.10 Standard Traceability

15.10.1 The analyst who prepares standards for their use has the responsibility for their accuracy and for all traceability considerations involved. Only chemical constituents of requisite and documented purity shall be used. This documentation becomes part of the traceability chain. All physical measurements including mass, volume, pressure, and temperature need to be traceable to national reference standards (A2LA, NIST, ASTM, etc) or must be proven through inter-laboratory studies) . Containers used, stability of the

Controlled Document

standards, and traceability of materials used in standards preparation must also be traceable.

15.11 Measurement Traceability

15.11.1 Traceability shall be extended to every analytical measurement. Micro-Methods assume responsibility for the accuracy of its measurements, which is supported by reliable calibrants and quality assurance practices. All aspects of work done within the laboratory must have internal trace ability. Every detail of the measurement process must be documented and easily retrievable. Data is traceable to the actual samples measured, the specific instrumentation used, and the specific operator. Instrument run logs are generated to document analysis dates and times. Calibration standards are associated with the related samples. Calculated results are traceable to the raw data. The source of all supplemental data must be identified and recorded.

15.11.2 Where traceability of measurements to SI units is not possible or not relevant, the same requirements, (for example, certified reference materials, agreed methods and/or consensus standards) shall be required.

15.11.3 Where traceability to national standards of measurement is not applicable, the laboratory shall collect and maintain records that provide satisfactory evidence of correlation of results, where possible (for example by participation in a suitable program of inter-laboratory comparisons, proficiency testing, or independent analysis).

15.11.4 All environmental tests, including equipment for subsidiary measurements (e.g. for environmental conditions) having a significant effect on the accuracy or validity of the result of the environmental test or sampling shall be calibrated prior to being put in service and on a continuing basis. This includes balances, thermometers, and control standards.

15.12 Measurement Uncertainty

15.12.1 Measurement uncertainty is defined as a variable associated with the results of measurement characterizing the dispersion of values that could reasonably be attributed on the measurement type. The definition of uncertainty focuses on the range values within which the true result value will be considering nominal variables contributing to the overall error of an analysis result of the same matrix.

15.12.2 Measurement uncertainty is documented and stored on the LIMS in the analysis/analyte section of all NELAP accredited analytical methods in accordance with 2003 NELAC Standards 5.5.4.6.1 and 5.5.4.6.2.

Controlled Document

Measurement uncertainty is required of all Micro-Methods Laboratory, Inc. subcontract laboratories.

15.12.3 Estimation of uncertainty measurement is applied to an analytical measurement except when analytical methods preclude such rigorous calculations. In certain cases, it is impossible undertake meteorologically and statistically valid estimations of uncertainty of measurement. In these cases the laboratory attempts to identify all components of uncertainty and make the best possible estimations, and ensure the form of reporting does not give an exaggerated impression of accuracy. Reasonable estimation is based on the knowledge of the performance of the analytical method and the scope of measurement on the basis of previous experience and validation data.

The degree of rigor required for uncertainty measurement depends on three factors: 1) requirements of method, 2) requirements of the client, and 3) existence of narrow limits on which decisions of conformance are assessed.

In practice the uncertainty of a result may arise from many possible sources to include: sampling, matrix effects and interferences, environmental conditions, uncertainty of weights and volumetric equipment, reference values, approximations and assumptions incorporated in the measurement method and procedure, and random variations.

In cases where a well-recognized method specifies limits to the values of major sources of uncertainty of measurement and specifies the form of presentation of calculated results, the laboratory is considered satisfied 2003 NEALC Standard 5.5.4.6.1 and 5.5.4.6.2 by following method and reporting instructions.

15.12.4 Determination of measurement uncertainty is achieved by Micro-Methods Laboratory, Inc. utilizing the calculated ranges of the Laboratory Control Spike samples, where possible. LCSs are matrix dependent and consistently represent the matrix effects of the method of choice experienced by the laboratory within a 12 month period prior to generation of reported result. Uncertainty is determined per analytical technique, where applicable, and is performed by the QAO or lab supervisor using a population of 50 most recent data points. Since the measurement of certainty is essentially constant for each method across a given matrix Micro-Methods Laboratory' s method of choice of determination of measurement of uncertainty is the 95% confidence interval.

15.12.5 As standard practice, Micro-Methods Laboratory, Inc. does not report measurement of uncertainty on the final report; however, LCS limits are reported in the final report to inform client of method performance at the 95%

Controlled Document

confidence interval for the analytical method without regard to regard to client specific matrix effects generated by sampling process or other variables. If client requires specific uncertainty measurements in the QAP, uncertain measurements will be determined for each analytical method based on a minimum of 10 matrix specific spiked sample result determinations comparable to acceptable laboratory procedure of determination of measurement of uncertainty and/or agreement with the laboratory on uncertainty measurements prior to submitting samples for analysis.

15.13 Laboratory Consumables

15.13.1 Laboratory consumables shall be protected, isolated, segregated, and monitored, to the extent possible, for in-house contamination. Sample containers used for trace analysis are purchased pre-cleaned with documentation. Some containers are purchased containing preservatives, such as VOA vials for soils and Oil and Grease Sample bottles to minimize potential for laboratory contamination. Coliform bottles are purchased with chlorine reduction chemicals required by the method.

15.13.2 Bulk standards and solvents shall be stored in the chemical room separate from the laboratory activities to provide a safe storage environment, while reducing the potential for degradation or cross contamination. Opened standards shall be stored in the chemical room in zip lock bags or metal cans to reduce potential for cross contamination.

15.13.3 Bulk standards and solvents shall always be unopened during transport through the laboratory.

15.13.4 To the extent possible, solvents and reagents shall be prepared under the hoods.

15.13.5 Glassware shall be washed and maintained appropriately for the analyses for which they are used.

15.13.6 Organic solvents shall be segregated from the volatiles lab.

15.13.7 No containers of solvents or reagents shall be left unattended or opened for any length of time longer than necessary to complete the activity.

15.13.8 All waste shall be disposed of as soon as possible. Waste containers shall be kept closed except when transfers are made.

15.13.9 Vials for sample reduction shall come from a vendor specializing in this activity.

15.13.10 Disposable Pipettes shall be used for sample transfers when measurement accuracy is not critical.

15.13.11 All glassware, burettes, and pipettes used for accurate measurement shall be Class A. Certificates for Class A syringes are located in the lab area of use (ie. volatile lab, extract lab, etc.).

Controlled Document

15.14 Receipt and Review of Analysis Request

15.14.1 For all samples received at the laboratory, the sample custodian shall check for evidence of method requirements for the analysis requested. The sampler or project manager most often initiates such evidence. If no information exists to ascertain the methods employed, the sample custodian shall notify the lab supervisor, who shall in turn notifies management. Management or their designee shall research the possible methods available based on equipment at the laboratory and laboratory capability. The client shall be contacted for method preferences, and, if none exist, the laboratory representative shall advise on the appropriate methods that would best suit the client's needs. The lab representative shall record the methods requested, the date, time, and person contacted in a bound lab notebook. If enough space exists to write in the methods on chain of custody, this can be done in lieu of the notebook entry. When a project requires a complicated analysis scheme, the laboratory representative shall ask the client to fill out an analysis request form to aid in meeting the data users' needs. The Laboratory Director, the QAO, or lab supervisor shall assist the client in this action.

15.14.2 The Laboratory Director or his designee shall review all analysis requests, evaluate, and approve in writing if acceptable.

15.15 Solvent, Reagent, and Adsorbent Check Analysis

15.15.1 Solvents used in the laboratory must be suitable for the analytical process. All solvents used in the laboratory for extractions are pesticide grade. Manufacturer's purity documentation is retained for each lot of solvents and must meet the requirements established in the analytical procedure for which the solvent will be used. Solvents are monitored by lab reagent blanks, method blanks, and/or

15.15.2 Reagents must meet the requirements for the methods for which they are used.

15.15.3 Florisil Check (required for CLP work)

15.15.3.1 Florisil cartridges must be verified as acceptable prior to being used for cleanup according to the procedure established in the most current SOW.

Controlled Document

15.16 List of Analytical Equipment in Service

Laboratory Instruments at Micro-Methods Laboratory, Inc.

# In Service	INSTRUMENT
10	Analytical Balances
2	Autoclaves
2	Biological Incubators
2	Block Digesters
2	BOD Incubators
2	Bomb Calorimeter
6	COD Distillation Setups
2	Conductivity Meters
6	Cyanide Distillation Setups
3	DO Meters
4	Drying Ovens
20	Continuous Liquid-Liquid Extractors
2	Zymark Turbovaps
20	KD flasks and concentrator tubes with Snider Ball tubes
1	Gel Permeation Cleanup Instrument (GPC)
1	HPLC PE UV and Fluorescence
1	ICP JY
1	PE 5100 AA Graphite Furnace
1	PE 3100 AA Flame
1	Ion Chromatograph Dionex IC20
1	IR Spectrophotometers
1	Mercury Cold Vapor Units
2	pH/ISE Meters
6	Phenol Distillation Setups
2	Sample Concentrators
5	TCLP (Nonvolatile) Extractor Tumblers
5	TCLP (ZHE) Tumblers
1	TOC Analyzer
6	Top Loading Balances
2	Turbidity meters
1	UV/VIS Spectrophotometers
8	Water baths
2	Agilent 6890 GC, with 5973 MSD, 7683 auto sampler for Semi Volatile Analysis

Controlled Document

1	**Agilent 6890 GC, with 5973 MSD, with OI Eclipse P&T, OI 4552 Water/Soil Auto sampler**
1	**Agilent 6890 GC, with 5973 MSD, with Tekmar Dohrmann Solatek 72 Multimatrix Vial Auto Sampler**
1	**Hewlett Packard 5890 GC with 5970 MSD and 7673-auto sampler**
1	**Agilent 6890 GC with FID/PID, with 4560 P&T and OI 4552 Water/Soil Auto sampler**
1	**Hewlett Packard 5890 with FID with 7673 auto sampler and gas sampling injector**
1	**Agilent 6890 GC with dual ECD detectors and dual 7683-auto sampler**
1	**Hewlett Packard 5890 GC with PID/ELCD, OI 4560 P&T, and DPM 16 Auto sampler**

1	**TOC Instrument**
3	**Drying Ovens**
1	**Turbid meter**

15.17 General Housekeeping

15.17.1 The laboratory must be appropriately cleaned and maintained in order to ensure that the laboratory does not contribute to sample contamination

15.17.2 It is the responsibility of all staff to maintain an environment conducive to producing analytical results free from laboratory contaminants. It is the responsibility of the Lab Director, Lab Supervisors, Safety Officer and QAO to provide the input for determining the extent of control based on its particular circumstances such that the impact from environmental condition has no effect on the test results.

15.17.3 All work areas and testing equipment shall be cleaned to levels appropriate for the tests performed in that area.

15.17.4 Analysts/Technicians are responsible for washing dirty glassware, properly disposing of unused waste chemicals and reagents, and returning unused samples to the storage coolers.

15.17.5 Bench tops and counters shall be wiped down daily and immediately following a spill.

15.17.6 Work spaces (access and entryways to the laboratory; sample receipt areas; sample storage areas; chemical and waste storage areas; and, data handling and storage areas) are cleaned and maintained frequently to ensure unencumbered work areas.

Controlled Document

16.0 PREVENTIVE MAINTENANCE

16.1 Preventive Maintenance Program

16.1.1 This section describes the laboratory personnel responsibilities for carrying out a comprehensive preventive maintenance program for all instruments and test equipment used in the analytical and testing activities. It shall include an overview of the program implemented by Micro-Methods' Management for maintaining this equipment in optimum operating condition. This section applies to all gauges, measuring equipment, test instruments included in the laboratory calibration program, i.e., any equipment used for making analytical determinations. Each item of equipment and associated software shall be uniquely identified with a system or instrument ID#, where practical. Records shall be kept of the following, where practical and if they exist:

16.1.1.1 The identity of the item of equipment and its software; The manufacturer's name, type identification, and serial number or other unique identification; Checks that equipment complies with the specification; The current location; The manufacturer's instructions, if available, or reference to their location; Dates, results and copies of reports and certificates of all calibrations, adjustments, acceptance criteria, and the due date of next calibration; The maintenance plan, where appropriate, and maintenance carried out to date; documentation on all routine and non-routine maintenance activities and reference material verifications; Any damage, malfunction, modification or repair to the equipment; Date received and date placed in service (if available);If available, condition when received (e.g. new, used, reconditioned).

16.1.2 The laboratory shall conduct an orderly program of positive actions (equipment cleaning, lubricating, reconditioning, parts replacement, adjusting and/or testing) to prevent instruments or equipment for failure during use. The purpose of this maintenance is to increase or maintain measurement system reliability. Without such a program, instrument down time increases and sample through-put time increases.

16.1.3 Instruments shall not be misused or abused, shall always be handled safely. Field instruments shall be transported in protective cases. Instruments in storage shall be in protected from environmental

Controlled Document

hazards and shall be visually inspected periodically for deteriorated conditions.

16.1.4 All instrumentation in use shall be adequately maintained to ensure proper function and operation. Al l non-functioning instrumentation shall be removed from service, tagged as "out of service", and if repairs require sending the instrument to the manufacturer shall not be place into service following the repairs until the instrument has met calibration and method acceptance criteria. Saturated detectors or grossly contaminated instruments shall be taken out of service, until such time as they are decontaminated or repaired. Demonstrations of proper calibration, stability, meeting acceptance criteria, and reproducibility are required before an instrument can be returned to service.

16.1.5 Qualified personnel shall only operate instrumentation.

16.2 Instrument Startup for New Instruments, New Operators, or RM Changes

16.2.1 Each new instrument or equipment must have an initial demonstration of capability where required by the method or procedure or whenever there is a significant change in instrument type, personnel, or reference method. A demonstration of capability form must be maintained in the files of the operator. All documentation from the manufacturer must be maintained.

16.2.2 The equipment and the software used for testing and sampling shall be capable of achieving the accuracy required in the method and shall comply with specifications relevant to the environmental tests concerned.

16.2.3 Equipment (including that used for sampling) shall be calibrated or checked to establish that it meets the laboratory's specification requirements and complies with the relevant standard specifications prior to use. It is the responsibility of the Lab Supervisors to document this activity.

16.2.4 All raw data records shall be maintained that document or show equipment performance.

16.3 Preventive Maintenance Schedule

16.3.1 The Quality Assurance Officer and Lab Director shall prepare and implement a preventive maintenance schedule for laboratory measurement systems. The Lab Supervisors shall ensure that the

Controlled Document

schedules are followed (refer to SOP *Preventive Maintenance*). Preventive maintenance and repairs shall be documented in the maintenance logbooks as support that the instrumentation is in good working condition and that it is properly maintained, inspected, and cleaned. Instruments that have been subjected to overloading or mishandling, which gives suspect results, or has been shown to be defective shall be taken out of service until it has been repaired and verified by calibration or test to perform properly. Data that may have been affected by the instrument shall be examined for suitability.

16.3.2 Micro-Methods have in stock all consumable items necessary to operate and maintain all instrumentation. Additionally, many electronics parts are also stocked. Only qualified laboratory personnel are allowed to perform repairs of major instrumentation (Lab Director, Lab Supervisors, and QAO). Some instrumentation is under service contract.

16.4 Equipment Failure/Natural Disaster Contingency Plan

16.4.1 Micro-Methods have back-up instrumentation for all major instrumentation in use at the laboratory. In the event that there is equipment failure of both primary and secondary instrumentation, the client shall be notified and arrangements for transporting the samples to another laboratory, approved by the client, shall be discussed. In most cases repairs are completed very quickly, due to the proximity of the laboratory to the location of manufacturer's service engineers.

16.4.2 The following steps shall be taken to prepare the laboratory when a Hurricane Watch is issued:

16.4.2.1 The Supervisors and their subordinates shall evaluate the status of sample analyses currently in progress and estimate the time of completion on each lab file. Analysts may have to work overtime to complete pending analyses.

16.4.2.2 The sample custodian and Lab Supervisors or their designees shall check the sample inventory stored in refrigeration units to prepare the units for the potential weather.

16.4.2.3 The Lab Director, Lab Supervisors, or their designees shall call clients to notify of sample status and to request approval for overtime, if required to complete the analyses to meet holding times or client data delivery requirements.

Controlled Document

16.4.2.4 The Field Technicians are responsible for ensuring that all waste drums are capped, secured, and locked in the waste drum storage shed. Use tie downs if necessary.

16.4.2.5 Place all corrosive and flammable chemicals into their proper storage areas.

16.4.2.6 The Office Manager shall check all emergency phone numbers of clients and contacts. The Office Manager shall verify that home phone numbers, cellular phone numbers, and pager numbers for all laboratory personnel are current and provide each employee with those numbers. It is the responsibility of each lab employee to program contact numbers into their own phones. All laboratory employees shall be subject to calls into work as required if weather conditions deteriorate quickly.

16.4.2.7 The LIMS Administrator is responsible for ensuring that the Server has recent backup. As the weather deteriorates the Server shall be backed up just prior to shutting it down. In the event that a Hurricane Warning is issued, 2 back up tapes shall be made. One tape shall be placed in a secure, fireproof cabinet and then locked. The other tape shall be given to a trusted employee farthest from the anticipated point of landfall. Operating Software shall be treated similarly. Individual workstations shall be backed up as needed.

16.4.2.8 Bag ice from ice machine and place as many bags as possible into the freezers for possible post hurricane use.

16.4.3 The following steps shall be taken to prepare the laboratory when a Hurricane Warning (Landfall within 72hours) is issued:

16.4.3.1 Place all pending samples and extracts into transport coolers and place in the walk-in cooler for storage. Lock the walk-in cooler.

16.4.3.2 Power down all instrumentation and computers and disconnect power cables. After the instruments have cooled down, cover in 6ml poly sheeting.

16.4.3.3 Place all moveable equipment onto the counter tops in case of potential flooding (Micro Methods is south of Interstate 10, but not in a flood zone)

16.4.3.4 It is the responsibility of the Organics staff and the Inorganic staff to perform the following tasks. All high-pressure gas cylinders must be disconnected, capped and laid horizontally on the concrete slab inside of the gas bottle containment area. All gas lines must be capped and labeled to

Controlled Document

ensure that moisture does not enter the lines and that correct connection is made following the foul weather.

16.4.3.5 It is the responsibility of the field technicians to fill all vehicles with gasoline and oil, if needed. Fill all 5-gallon gas cans for generator use, in case of extended periods without power. Check available power extension cords and strips.

16.4.3.6 It is the responsibility of the analysts to collect all bench notebooks and place them into the file cabinets in their respective lab areas.

16.4.3.7 Clients with samples pending should be contacted to determine if the samples need to be shipped to another NELAC accredited laboratory, if no standing agreement has been made prior to accepting work.

16.4.4 Following the Hurricane, employees should first attempt to contact their immediate supervisor or lab director with personal damage related issues and to discuss availability to work. If the employees are unable to make contact, report to work as soon as possible and leave a written message in the Lab Director's office or the office of their immediate supervisor.

16.4.5 The first employees to return to the laboratory following a natural disaster should safely assess the damage to the laboratory and report to Management and if possible start the generators for power to incubators and sample storage areas. Mark down the estimated time that the laboratory lost power and the time the generators were started. Testing in progress during the power outage must be qualified and discussed in the narrative report.

16.6 Instrument Maintenance Log Books

16.6.1 All major instrumentation has an associated logbook for maintenance and repair documentation. All maintenance and repair information is documented in these logs. The logbooks are maintained within the local laboratory area near the instrument through out its useful life.

16.6.2 All major service and repairs shall be documented in the logbooks. Service or repair records performed by outside technicians must be stapled to the logbook on the date that the repairs or service occurred.

16.6.3 When the logbook pages have been completely filled or the instrument is permanently removed from service the logbook shall be maintained by the QAO as permanent record on site for a period of one year, and then transferred to the offsite records storage area for a minimum of 7 years.

Controlled Document

17.0 QUALITY CONTROL CHECKS AND ROUTINES TO ASSESS PRECISION AND ACCURACY AND METHOD DETECTION LIMIT CALCULATIONS

17.1Field Quality Control Sampling Requirements

17.1.1 All equipment blanks are collected and analyzed for the same parameters as the associated samples. All blanks are preserved, transported, documented, and handled as if they were samples. Once collected they remain with the sample set until receipt by the laboratory. Rinsing the sample equipment with analyte-free water and collecting the rinsate in appropriate sample containers prepare all equipment blanks.

17.1.2 The following type of blanks and duplicates are collected in the field as required:

17.2Pre-cleaned Equipment Blank

17.2.1 These blanks are collected from sampling equipment that has been brought to the site pre-cleaned and ready for use. A minimum of one equipment blank is collected for each water and/or soil matrix sample group. These blanks are always collected at the initiation of the sampling episode.

17.3Field Cleaned Equipment Blank

17.3.1 These blanks are collected from sampling equipment after the equipment has been in the field and between sampling points.

17.4Trip Blank

17.4.1 These blanks are required only if samples are to be analyzed for VOCs. However, Trip Blanks for semi-volatile are routinely sent out. The sample custodian, who fills the vials and bottles with analyte-free water, prepares these blanks. The blanks are placed in the same transport containers as the associated samples (VOC vials with volatile samples, Liter bottles with semi-volatile samples). The blanks remain with the samples during the sampling period and are transported to the laboratory in the same shipping

Controlled Document

containers as the samples. The trip blanks are not opened at any time during the sampling episode. Trip blanks are submitted for each cooler that transports empty or full sample containers. Inorganic trip blanks are routinely prepared and used in the same manner, as required.

17.5Field Duplicates

17.5.1 Field duplicates are collected and analyzed for the same parameters as the associated samples. They are preserved, transported and documented in the same manner as the samples. These samples are not substituted for laboratory duplicates. These duplicates are collected and analyzed to measure variability inherent in the sampling process. Duplicates are obtained by "duplicating" the entire sample acquisition technique that was used to obtain the first sample. Collect sample duplicates for water from successively collected volumes (i.e., samples from the next bailer of water). Duplicates for soils are collected from the same sample source and device.

17.6Split Samples

17.6.1 When specific projects or the clients require split samples as a means of determining compliance or as additional quality control, these samples shall be collected and processed as required. These samples are intended to measure variability between laboratories and are collected as sub samples of the same parent sample. Note that a true split sample of soil, sediment, or sludge is nearly impossible to collect under field conditions. Split samples are collected, preserved, transported and documented using the same protocols as the related samples. Split samples for water are collected in one of two ways:

1) Mix the sample in a large, appropriately pre-cleaned, intermediate vessel and pour aliquots of the mixed sample into sample containers. (This method is not used if sampling for VOCs.)

2) Fill the sample containers from consecutive sample volumes from the same sampling device. When the sampling device does not hold enough samples to fill the sample containers, the following protocol is used:

Controlled Document

a. Fill the first containers with half of the sample and pour the remaining sample into the second container.

b. Obtain additional sample, and pour the first half into the second container. The remaining portion is poured into the first container.

c. Continue with steps (a) and (b) until both containers are filled.

17.6.2 Field QC shall be according to the following table unless excluded by the client or regulating agency:

Field Control Sampling Frequency

Number of Samples	Pre-cleaned Equipment BLK	Field Cleaned Equipment BLK	Trip BLK (VOCs)	Field Duplicate
10+	Minimum of one then 5%	Minimum of one then 5%	One per cooler	Minimum one then 5%
5-9	One*	One*	NR	One
<5	One*	One*	NR	NR

NR = Not Required
BLK = Blank

17.7Quality Control on Field Measurements

17.7.1 All field instruments are initially calibrated at the beginning of each working day. Continuing calibration checks are analyzed at intervals of no more than 4 hours and at the end of the sampling period (for closure) to determine if the instrument has maintained calibration. Field instruments shall be recalibrated if the continuing calibration checks fail to meet acceptance criteria. All samples associated to the failed calibration shall be re-analyzed. All quality control data is recorded in the daily field notes in bound notebooks.

Controlled Document

17.8Laboratory Quality Control Checks—General/ Analytical Batch Definition

17.8.1 Micro-Methods Quality Plan requires that the quality control requirements stated in the methods must be followed. If no quality control requirements are listed in the method, or if the quality control requirements are less stringent than those listed below, Micro Methods shall follow the guidelines listed in this section.

17.8.2 Matrix spikes are used as laboratory controls when required by the method. Method control criteria and Lab Control Standards and blanks are used as the basis of data acceptance/rejection criteria for analytical batches.

17.8.3 Clients are requested in advance to notify Micro-Methods if there are QC requirements needed to satisfy their data requirements. Additional sample amounts may be required to perform the QC requirements. Samples for QC analyses shall be taken from the same container where possible.

17.8.4 Samples shall be processed as analytical batches. An analytical batch is defined as 20 (10 if required by the method, client, or regulating agency) or less environmental samples of a similar matrix with the same method, personnel, and lots of reagents. If the number of samples in a batch is greater than 20, each group of 20 samples or less is processed as a batch. Samples processed as analytical batches are assigned a "QC Batch Number," which associates the samples with the appropriate QC items.

17.9 Laboratory Quality Control Indicators

17.9.1 Method Blank

17.9.1.1 A Method Blank is processed and analyzed with each analytical batch of samples at a minimum of one per 12-hour shift. The method blank is used to assess the analytical batch for possible contamination during the preparation and processing steps. The method blank shall be processed alongside and under the same conditions as the associated samples and includes all steps of the analytical procedure. Any affected samples associated with a contaminated method blank shall be reprocessed for analysis or the results reported with appropriate

Controlled Document

qualifiers. The method blank shall be of a matrix type that is similar to the associated samples and is known to be free of the analytes of interest. While the goal is to have no detectable contaminants, each method blank shall be evaluated by the analyst as to the nature of the interference and the effect on the analysis of each sample within the batch. Any contamination greater than the reporting limit detected in the blanks by the analyst shall immediately be reported to the Lab Supervisor or QAO and corrective action initiated. The source of the contamination shall be investigated and measures taken to minimize or eliminate the problem and affected samples shall be reprocessed or the data shall be qualified if:

17.9.1.1.1 The concentration of a target analyte detected in the blank is at or above the reporting limit as established by the test method or by regulation, and is greater than 1/10 of the amount measured in any sample in the batch.

17.9.1.1.2 The blank contamination otherwise affects the sample results as per the test method requirements or the individual project data quality objectives.

17.9.1.1.3 In the event a blank is determined to be contaminated, the cause shall be investigated and measures taken to minimize or eliminate the problem. Samples associated with a contaminated blank shall be evaluated as to the most appropriate corrective action for the batch (reprocessing or data qualifying). The corrective action shall be documented.

17.9.2 Surrogate Spikes

17.9.2.1 Surrogates are used most often in organic chromatography test methods and are chosen to reflect the chemistries of the targeted compounds of the method. They are often specified by the mandated test method and are deliberately chosen for their being unlikely to occur as an environmental contaminant, such as deuterated analogs of select compounds. They are added prior to sample preparation/ extraction and provide a measure of the recovery for every sample matrix. Surrogates are added to all samples, blanks, matrix spikes, calibration standards, and lab control standards, where required by the method and available.

17.9.2.2 The results are compared to the acceptance criteria as published in the mandated test method. Where there are no established criteria, the QAO shall determine acceptance criteria from lab-generated data. Surrogate recovery outside the acceptance criteria must be evaluated

Controlled Document

for the effect indicated for the individual sample results. The appropriate corrective action may be guided by the data quality objectives or other site specific requirements. Results reported from analyses with surrogate recoveries outside the acceptance criteria shall be qualified.

17.9.3 Matrix Spikes (MS)

17.9.3.1 Data Quality Indicators for specific samples using a designated reference method to determine the effect of the sample matrix on the target analytes shall be documented and monitored. Examples of matrix specific QC include the following:

17.9.3.1.1 Matrix Spikes (MS)
17.9.3.1.2 Matrix Spike Duplicates (MSD)
17.9.3.1.3 Sample Duplicate Analyses
17.9.3.1.4 Surrogate Spikes

17.9.3.2 Matrix Spikes are matrix specific QC samples that indicate the effect of the sample matrix on the precision (RPD) and accuracy (% Recovery) of the results generated using the selected method. The information from these indicators is sample/matrix specific and would not normally be used to determine the validity of the entire batch. Matrix Spikes shall be processed, when sufficient sample amount exists to perform the analysis, at a frequency of 5% of samples per analytical batch. Accuracy (% Recovery) shall be assessed from matrix spike measurements.

17.9.3.3 The spiking components shall be as required or specified by the selected reference method. Any permit specified analytes, as specified by regulation or requested by the client shall also be included. If there are no specified components, spiking shall be as follows:

17.9.3.4 For components that interfere with an accurate assessment, such as spiking simultaneously with technical chlordane, Toxaphene and PCBs, the spike should be chosen that represents the chemistries and elution patterns of the components to be reported.

17.9.3.5 Whenever possible, spike with all target compounds. For test methods that have long lists of analytes, a representative number may be chosen. The analytes selected should be representative of all analytes reported. The following criteria shall be used for determining the minimum number of analytes spiked. All targeted components must be included in the spike mixture over a 2-year period.

17.9.3.5.1 For methods that include 1-10 targets, spike all components.

Controlled Document

17.9.3.5.2 For methods that include 11-20 targets, spike at least 10 or 80% whichever is greater.

17.9.3.5.3 For methods with more than 20 targets, spike at least 16 components or 80% whichever is greater.

17.9.3.6 The results from matrix spike/matrix spike duplicate analyses are primarily designed to assess the precision and accuracy of analytical results in a given matrix and are expressed as Relative Percent Difference (Precision) and % Recovery (accuracy) allowing for comparison to established acceptance criteria. The results are compared to the acceptance criteria a published in the reference method. Where there are no established criteria, the QAO shall determine Upper and Lower acceptance criteria from lab generated data using the 95% and 99% Confidence Levels.

17.9.4 Matrix spike duplicates (MSD)

17.9.4.1 Matrix Spike Duplicates shall be processed, when sufficient sample amount exists to perform the analysis, at a minimum frequency of 5% of samples per analytical batch. Precision shall be assessed from matrix spike duplicate measurements.

17.9.5 Sample Duplicate Analysis (Matrix Duplicate Analysis)

17.9.5.1 Matrix duplicates are defined as replicate aliquots of the same sample taken through the entire analytical procedure. The results from this analysis indicate the precision (RPD) of the results for the specific sample using the selected reference method. The matrix duplicate provides a usable measure of precision only when target analytes are found in the sample chosen for duplication.

17.9.5.2 Duplicate samples shall be processed, when sufficient sample amount exists to perform the analysis, at a minimum frequency of 5% of samples per analytical batch. When high concentrations of organics are known to be present, a sample duplicate may be substituted for a matrix spike. Precision shall be assessed on duplicate samples. Samples chosen for duplicate analyses should be random and rotated among clients. Samples with obvious contamination should have first consideration for duplication.

17.9.5.3 The results from matrix duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference. Results are compared to the acceptance

Controlled Document

criteria as published in the selected reference method. When there are no established criteria, the QAO shall generate RPD acceptance criteria from lab generated data using 95% and 99% Confidence Levels.

17.9.6 Lab Control Sample (LCS)

17.9.6.1 Lab Control Sample shall be processed with every analytical batch as required by the method or regulating agency. The LCS is used to evaluate the performance of the analytical system, including all preparation criteria and analysis steps. Results of the LCS shall be compared to established criteria and, if found to be outside of the acceptance criteria, indicates that the analytical system is "out of control". Any affected samples associated with an out of control LCS shall be reprocessed for re-analysis or the results qualified. The LCS shall be analyzed at a minimum of 1 per analytical batch. Exceptions would be for those analytes for which no spiking solutions are available such as TDS, TVS, TS, pH, color, odor, temperature, DO or turbidity. The LCS is a quality system matrix, known to be free of target analytes, spiked with known and verified concentrations of analytes. The Matrix Spike may be used in place of this control as long as the acceptance criteria are as stringent as for the LCS. Alternatively the LCS may consist of a media containing known and verified concentrations of analytes or as Certified Reference Material (CRM). All analyte concentrations shall be within the calibration range of the instrument and range of the methods. The spiking analytes shall be as specified by the mandated test method or other regulatory requirement or as requested by the client (written authorization required). In the absence of specified spiking components the laboratory shall spike per the following:

17.9.6.2 For components that interfere with an accurate assessment, such as spiking simultaneously with technical chlordane, Toxaphene and PCBs, the spike should be chosen that represents the chemistries and elution patterns of the components to be reported.

17.9.6.3 Whenever possible, spike with all target compounds. For test methods that have long lists of analytes, a representative number may be chosen. The analytes selected should be representative of all analytes reported. The following criteria shall be used for determining the minimum number of analytes spiked. All targeted components must be included in the spike mixture over a 2-year period.

Controlled Document

17.9.6.3.1 For methods that include 1-10 targets, spike all components.

17.9.6.3.2 For methods that include 11-20 targets, spike at least 10 or 80% whichever is greater.

17.9.6.3.3 For methods with more than 20 targets, spike at least 16 components or 80% whichever is greater.

17.9.6.4 The results of the individual batch LCS are calculated in percent recovery allowing comparison to established criteria. The individual LCS is compared to the acceptance criteria published in the reference method. Where there are no established criteria, the QAO shall determine Upper and Lower acceptance criteria from lab generated data using the 95% and 99% Confidence Levels. Client specified criteria shall be agreed upon prior to accepting work. An LCS that is determined to be with the acceptance criteria effectively establishes that the analytical system is in control and validates system performance for the samples in the associated batch. Samples analyzed along with an LCS determined to be "out of control" shall be considered suspect and the samples should be reprocessed and re-analyzed or the data reported with appropriate qualifiers. The Lab supervisor shall contact the client if the impact on the data is significant, explain the anomaly and request additional sample if re-analysis is required.

17.9.6.5 If a large number of analytes are spiked in the LCS, it becomes statistically likely that a few will be outside control limits. At the 95% confidence level with the analytical system in control, 1 result out of 20 may be outside acceptance criteria. Having a small number of analytes that have recoveries outside the control limits does not necessarily indicate that the system is out of control and may not require corrective action. Upper and lower Marginal Exceedance (ME) limits shall be established to determine when corrective action is necessary. A ME is defined as being beyond the LCS control limits (3 standard deviations from the mean), but within the ME limits. ME limits shall be established at between 3 and 4 standard deviations around the mean recovery. The number of allowable marginal exceedance limits is based on the number of analytes in the LCS. If more analytes exceed the LCS control limits than is allowed, or if one analyte exceeds the ME limits, the LCS fails and corrective action is necessary. This ME approach is most relevant for methods with long lists of target compounds. It does not apply to lists with 10 or less analytes.

17.9.6.5.1 <11 analytes in LCS, 0 analytes are allowed in ME of the LCS Control Limit

17.9.6.5.2 11-30 analytes in LCS, 1 analyte allowed in ME of the LCS Control Limit

Controlled Document

17.9.6.5.3 31-50 analytes in LCS, 2 analytes allowed in ME of the LCS Control Limit

17.9.6.5.4 51-70 analytes in LCS, 3 analytes allowed in ME of the LCS Control Limit

17.9.6.5.5 71-90 analytes in LCS, 4 analytes allowed in ME of the LCS Control Limit

17.9.6.5.6 >90 analytes in LCS, 5 analytes allowed in the ME of the LCS Control Limit

17.9.6.6 Marginal exceedances must be random. If the same analyte exceeds the LCS control limits repeatedly, it is an indication of a systemic problem. The source of the error must be located and corrective action shall be initiated. The QAO shall monitor the exceedances using statistical software. Marginal Exceedances should not be more than 2% of the total number of times that the target compound is analyzed without corrective action initiated.

17.9.7 Lab Control Sample Duplicates (LCSD)

17.9.7.1 Lab Control Sample Duplicates shall be processed when not enough samples exist to perform matrix spike duplicate analyses to monitor precision or as required by the client or regulatory agency.

17.9.8 Quality Control Check Standard

17.9.8.1 QCS (blind sample) shall be processed at a minimum of semi-annually. These samples shall be submitted as blind samples. Results of the analysis shall not be provided to the analyst until after the analysis. When results are not acceptable, the results are investigated, corrective action initiated and reported in a QA report.

17.9.9 Solvent and Reagent Purity Checks

17.9.9.1 Solvent or Reagent or Method Blanks shall be processed where required with appropriate documentation. For most solvents purity documentation is associated with the solvent lot number.

Controlled Document

17.9.10Adsorbent Checks

17.9.10.1 Absorbent checks are for clean up cartridges are processed as required by the analytical procedure. All documentation is retained.

17.10 Spiking Procedures

17.10.1Samples and or Lab Controls shall be spiked with the target compounds for the analysis requested. When extended lists of target compounds are requested or are part of specific project, these shall be spiked also unless the mixture would contain incompatible compounds. For extended lists with incompatible compounds, the matrix spikes and or Lab Controls shall be spiked with at least 80 % of the required target compounds.

17.10.2Spiking shall be done according to the method requirements. In the absence of listed spiking components, spiking is done according to the following for matrix spikes and lab controls:

1) For components that interfere with accurate assessment such as spiking individual pesticides with multi-component compounds (PCB, Chlordane, and Toxaphene) the spike chosen should represent the compounds being reported.

17.10.3When long lists of compounds are required, a shorter list may be used provided the spiking compounds are representative of the entire method. All compounds in the list must be spiked within a period of two years. The shorter spiking lists are determined as follows:

1) For methods that include 1-10 compounds, spike all of the compounds.
2) For methods that include 11-20 compounds, spike at least 10 compounds or 80% whichever is greater.
3) For methods that include greater than 20 compounds, spike at least 16 compounds or 80% whichever is greater.

17.10.4Matrix Spiked Samples and or Lab Controls shall be rotated among clients such that no one sample receives all the quality control. New or unknown samples should be chosen as quality samples when enough sample exists to perform the QC requirements. When Clients request Quality checks on their samples it is the responsibility of the analysts to meet these needs.

Controlled Document

17.11 Sample Re-extraction/Re-analysis

17.6.1 For matrix spikes or LCSs, re-extraction and/or re-analysis shall not be performed if (all data exceeding acceptance control limits shall be appropriately qualified):

1) All control criteria are met.

2) The spike recovery is above the upper control limit and the compound is not detected in the sample.

3) The recoveries of no more than 1 target compound are outside control limits when 5 to 10 compounds are spiked.

4) The recoveries of no more than 2 target compounds are outside control limits when 11 to 20 compounds are spiked.

5) The recoveries of no more than 3 target compounds are outside control limits when 21 to 30 compounds are spiked.

6) The recoveries of no more than 5 target compounds are outside control limits when 31 to 40 compounds are spiked.

7) The recoveries of no more than 7 target compounds are outside control limits when 41 to 50 compounds are spiked.

8) The recoveries of no more than 9 target compounds are outside control limits when 51 to 60 compounds are spiked.

9) The recoveries of no more than 12 target compounds are outside control limits when 61 or more compounds are spiked.

Note - The following compounds shall not be evaluated for corrective action because of their instability under routine preparation and analytical procedures (data shall be qualified for QC failures on these compounds):

a. Volatile Organics:

Acrolein
2-Choroethyl vinyl ether

Controlled Document

Pentachloroethane
Benzyl chloride
Carbon disulfide

b. Semi-Volatile Organics:

Benzidine
Benzoic Acid
Hexachlorocyclopentadiene

Note ---All QC failures must be discussed in the narrative report and the data qualified with appropriate qualifiers.

17.12 Inorganic and Wet Chemistry QC Checks

17.12.1**Method Blank** is processed and analyzed with each analytical batch of samples.

17.12.2**Calibration Blank** is processed and analyzed with each analytical batch of samples. A calibration blank is defined as an undigested blank to be used for background checks. These blanks are processed at frequency of 5%.

17.12.3**Lab Control Standard** (blank spike) is processed and analyzed with each analytical batch of samples (5%) as required by the method or regulating agency.

17.12.4**Matrix Spike** shall be processed and analyzed with each analytical batch (5%) to assess accuracy.

17.12.5**Matrix Spike Duplicate** shall be processed and analyzed at a minimum frequency of 5% (1 for every 20 samples) to assess precision.

17.13 Microbiology

17.8.1 Blanks as required by the Reference Method

17.13.1**Membrane Filter Analysis**: For each analytical batch of samples, a control blank (dilution water) is processed and run at the beginning, every 10^{th} sample (as a carry-over blank), and at the end of the process.

17.13.2**MPN Analysis**: A single tube of LTB broth media is inoculated with 10 milliliters of sterile phosphate buffered water (dilution blank control) and processed.

Controlled Document

17.13.3**MPN Analysis**: A single tube of LTB broth media is inoculated with 10 milliliters of sterile phosphate buffered water (dilution blank control) and processed.

17.13.4**Duplicates**: A minimum of 5% of the known positive samples that have been processed are analyzed in duplicate or a minimum of one duplicate analysis per month for MF and MPN analysis.

17.13.5**Positive/Negative Controls**: Microorganisms from ATTCC or equivalent sources are used to confirm the morphological and biochemical responses to the test media. Positive and negative controls are processed and run with each new media lot and monthly thereafter. Positive controls are processed with each analytical batch of Coliform samples. All drinking water samples testing positive for Coliform shall be confirmed. Ten percent of other source waters testing positive for Coliform shall be confirmed.

17.13.6**Water Quality Indicators**: Strict requirements for laboratory reagent grade water used in the lab are monitored and must be met before it is used in any microbiological testing. The table below lists parameters monitored and the frequency (requirements from *Manual for the Certification of Laboratories Analyzing Drinking Water* Chapter V, section 4.3).

Lab Water Monitoring Requirements

Parameter	Frequency	Acceptance Limits
Total Residual Chlorine	**Monthly**	**< 1.0 mg/L**
Trace Metals (Total Cd, Cr, Cu, Ni, Pb, Zn)	**Annually**	**< 1.0 mg/L**
Individual Metals	**Annually**	**0.05 mg/L (Not to exceed per contaminate)**
Conductivity	**Daily**	**< 2.0 umho cm @ 25C**
Heterotrophic plate count	**Monthly**	**< 500 CFU/mL**
Glassware Inhibitory Residue	**Annually or each lot of new detergent**	**< 15% difference between groups**
Suitability	**Annually**	**Ratio of growth 0.8: 3.0**

17.14 Assessing Precision and Accuracy and Setting Acceptance Limits

17.14.1 For SW-846 methods, matrices and QA targets are generated from matrix spikes and matrix spike duplicates of environmental samples or are taken from method specified limits. Sample results are entered into a statistical

Controlled Document

data base in the LIMS, which calculates the Upper and Lower Control Limits and plots control charts for each parameter at +/or –3 standard deviations. A minimum of 20-30 data points is used and control limits are updated annually. Control limit calculations are based on the procedures contained in The Handbook for Analytical Quality Control in Water and Waste Water 1979 and EPA SW-846 requirements. Acceptance Limits for 8000 are generated from Lab Data by the QAO and entered into the LIMS. Ongoing Precision and Accuracy charts are maintained by the QAO and reviewed annually and updated when trends indicate that limits can be expanded.

17.14.2Spiking concentrations for establishing and maintaining control limits are in terms of low, mid, or high levels as described by the following:

1) Low Level is defined as concentrations from the MDL to a level 5 times the MDL.
2) Mid Level is defined as the mean level between the MDL and the upper end of the linear range.
3) High Level is defined as concentrations at the upper end of the calibration range.

17.15 Method Detection Limits, PQLs/EQLs, and Reporting Limits

17.15.1Refer to ***SOP for MDL Studies DCN 3027.***

17.15.2**Method Detection Limits** are determined annually or whenever there is a significant change in the test method or instrument type or performance, in accordance with:

EPA – "Definition and Procedure for the Determination of the Method Detection Limit – Revision 1.11," 40 CFR Part 136, Appendix B;

17.15.3EPA's procedure is the most frequently used procedure requires that a minimum of seven spiked replicates be analyzed (40 CFR Part 136) or a minimum of 3spiked replicates (SW-846 Chapter 1) of lab reagent water or can be performed in the sample matrix, if required. The spiked matrices are subjected to the same processing steps required by the analytical procedure. Spiking levels are 3-5 times the estimated detection limit. The standard deviation of the replicate measurements is calculated. Then the MDL is

Controlled Document

computed by multiplying the standard deviation by the t – statistic (based on n-1 degrees of freedom) below.

No. of samples	t-statistic
3	6.96
4	4.54
5	3.75
6	3.36
7	3.14
8	3.00
9	2.90
10	2.82

Micro-Methods typically used 7-10 replicates to calculate MDLs.

17.16 Disclaimer

17.16.1 The MDL calculated using the above procedures is defined as the minimum concentration of a substance that can reliably be measured in reagent water and reported with a given confidence level that the analyte concentration is greater than zero. Micro Methods makes no claim that the MDLs determined using these procedures are achievable in environmental samples. Further, Micro Methods assumes no responsibility or liability for decisions made based on these MDLs in environmental samples.

17.16.2 Practical Quantitation Limits, Estimated Quantitation Limits, or Reporting Limits are typically reported in place of MDLs because MDLs are derived from analysis of spiked lab reagent water and may not be applicable in reporting environmental data. PQLs, EQLs, and Reporting Limits are defined as the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. Reporting Limits are established at 3-5 times the MDL.

17.17 Required MDL Documentation

17.17.1 Records that document sample/standard preparation, source and concentration (this includes protocols for preparation and certification, if applicable) are maintained. All required records specified in the Calibration SOP are maintained (refer to SOP *Calibration and Frequency*).

Controlled Document

Identification of analytical batch associated with QC samples (QC Batch Number). Calculations performed to determine QC results. Control limits used to evaluate analysis results and how these were determined.

17.18 MDL Study Documentation Requirements

17.18.1 Documentation for the MDL studies is conducted according to all other SOPs regarding sample and standard handling procedures, calibrations, QC checks and analyses. The documentation shall be permanent records.

17.18.2 Documentation includes:

1) Date of studies and calendar period for which the studies are applicable.

2) Analytical Methods used.

3) Identification of analyst responsible for analysis.

4) Compounds Studied

5) Instrument identification.

17.19 Selectivity

17.19.1 Selectivity is defined as the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances.

17.19.2 Lab Supervisors, where required, shall choose the most appropriate method or procedure to meet the client's data needs when the client is uncertain about methodology and needs direction from the laboratory.

17.19.3 The Organics Laboratory (GC/MS Lab) shall evaluate selectivity by following the quality checks and indicators established within the test method. This may include mass spectral tuning of GCMS instruments to meet method acceptance criteria or laboratory acceptance criteria in the absence of method criteria, second column confirmation or GCMS confirmation for pesticides and PCBs when required. Chromatography retention time windows shall be established as required by the reference method.

Controlled Document

17.19.4A Confirmation analysis (e.g. Duplicate analysis, second column confirmation, by another instrument type, or by GC/MS) shall be performed to verify the compound identification when positive results are detected on a sample from a location that has not been previously tested by the laboratory. Such confirmations shall be performed on GC and HPLC analyses for confirmation of pesticides, herbicides, base neutral/acid extractable or when recommended by the analytical method. Confirmation of GCMS results is not required, but should be performed whenever the laboratory has not previously analyzed the sample or whenever there is a significant difference in results when compared to previous results. For example, if the history for a sample has always been less than the reporting limit for Naphthalene and the current results show 100ug/l for Naphthalene, the analyst shall request a re-extract/re-analysis for confirmation. In the event that the re-extract result is less than, then the analyst with concurrence of the lab supervisor shall report both sets of data with the initial set qualified and discussed in the narrative as being suspect and suggest re-sampling and/or close observation of this sample point. If the re-extract result is similar to the initial result in question (100ug/l) the analyst with concurrence from the lab supervisor shall discuss the confirmation in the narrative.

17.19.5GC/MS analysis is the preferred detector for confirmation, but has limitations due to sensitivity. In some cases the analyst may be able to concentrate the extract enough to detect the levels of more sensitive GC instruments. Significant improvements in GCMS technology in detector sensitivity make confirmations on GCs more reliable. Confirmation is required unless stipulated in writing by the client. The analyst shall document all confirmations with concurrence of the lab supervisor in the narrative report.

17.19.6Selectivity for Metals determination shall employ ICP inter-element interference checks, sample blanks. GFAA can be used for confirmation for ICP and vice versa when required.

17.19.7Selectivity for Biological testing shall ensure identity and traceability. Reference cultures used for positive and negative controls shall be obtained from Remel or a recognized national collection, organization, or manufacturer recognized by the NELAP Accrediting Authority (LELAP). Microorganisms may be single use preparations or cultures maintained by documented procedures that demonstrate the continued and viability of the organism.

17.19.7.1 Reference cultures may be revived (if freeze-dried) or transferred from slants and sub cultured only once to provide reference stocks. The reference stocks shall be preserved by a technique that

Controlled Document

maintains the characteristics of the strains. Reference stocks shall be used to prepare working stocks for routine work. If reference stocks have been thawed, they must not be re-frozen and re-used.

17.19.7.2 Working stocks shall not be sequentially cultured more than 5 times and shall not be cultured to replace reference stocks.

18.0 DATA COLLECTION, REDUCTION, VALIDATION, AND REPORTING

18.1 Data Collection

18.1.1 Providing data of the highest quality is our goal at Micro-Methods. To accomplish this, a comprehensive program of data review is mandatory. Micro-Methods Management has implemented and extensive data reduction, review and validation program to support the analytical services provided. Data review, validation, and reporting are integral parts of all phases of analytical work, from sampling to document storage. Management endeavors to review all data in a consistent manner. Data reduction includes all activities that convert instrument/computer responses to reportable results. Data validation involves checking all field and laboratory data entries and calculations for errors and mistakes.

18.1.2 Data collection activities begin with the sample collection and custody records. Following receipt of the samples, the sample custodian checks the custody forms against the sample identification information, verifying and documenting correctness and anomalies observed in a bound laboratory notebook (refer to SOP *Sample Custody and Documentation*). A unique sample ID number is assigned to each sample. All anomalies detected that compromise the integrity of the sample are documented and the client is notified immediately. Following login the samples are distributed to the appropriate laboratory sections along with computer generated worksheets, anomaly reports, transit literature, and any pertinent documentation. Lab supervisors or the lab director reviews the analysis request and assigns the samples to the appropriate areas to be prepared and analyzed. Samples are tracked in each lab area to maintain continuous custody. Sample preparation is documented in bound notebooks, on worksheets and bench sheets.

18.1.3 Most of the analytical results are read directly from the analytical instruments without further reduction. Dilution factors and sample

Controlled Document

volumes or weights are added into the instrument computer where the results are calculated, thus minimizing calculation errors and data reduction errors. For analyses where calculation programs are not part of the software package, manual calculations are performed based on instrument output, readings, or responses.

18.1.4 The initial data collection is the responsibility of the analyst or field technician who operates the analytical instrument. The technician is responsible for the following:

1) Calculate spike recoveries and precision for duplicates or enter results into the LIMS for calculation.

2) Identify quality control data (blanks, spikes, duplicates, etc.) for review by the QAO.

3) Assure accurate transcription of sample identification numbers and results on all records.

4) Record all observations at the time they are made

18.2 Manual Data Reduction

18.2.1 Additional responsibilities of the analyst or field technician when manual data reduction is performed:

1) Assure that all readings or output are precisely measured and noted on the strip charts.
2) Select appropriate formulae for calculation of final results.
3) Enter the formulae and at least one complete sample calculation on the strip chart, on the chromatogram or in the lab notebook.
4) Assure that all data are accurately transcribed into notebooks, forms or spreadsheets.
5) Enter all manual calculations into notebooks or data records.
6) Check raw data entries with final computer output to assure accurate initial data entry.
7) Record appropriate and accurate information concerning sample identification, operating conditions, etc.

Controlled Document

18.2.2 If raw data is entered into a computer or spreadsheet for data reduction, Micro-Methods maintains a record of the formulae that are used by the computer or maintains a record of the verification process when such information is not available.

18.2.3 All raw data output is retained as part of the records. In addition, the following information is retained:

1) Instrument operating conditions.
2) Detector and column types.
3) Instrument configuration.

18.3 Computer/Integrator Reduction

18.3.1 Additional responsibilities of the analyst or field technician when computer data reduction is performed:

1) Assure that data used in final calculations are entered accurately: sample weights or volumes.

2) Properly interpret the computer output in terms of properly identified components, positive or negative identifications, and appropriate confirmatory measures.

3) Record appropriate and accurate information concerning sample identification, operating conditions, etc.

4) Calculate surrogate recoveries and internal standard responses.
5) GC and GC/MS analyses must be checked to verify that target components are within acceptable retention time windows and that additional confirmation, if needed, is initiated.

18.3.2 Most analytical instrumentation is interfaced with computers or integrators that identify and/or calculate final results. Data files and chromatograms are given a unique alphanumeric identifier by the analysts that uses LIMS generated Identifier or the date or sequence number of the analysis. Pertinent information is entered into the instrument logbooks and is periodically inspected for completeness by the supervisors. Logbooks are retained as permanent records. Supervisors will review the internal audit trail during these inspections to confirm that no data files were inappropriately altered.

Controlled Document

If anomalies are found, supervisor will take appropriate corrective actions and notify the QAO.

18.4 Manual Chromatographic Peak Integration

18.4.1 Refer to Standard Operating Procedure *Chromatographic Peak Integration DCN 4008.*

18.4.2 Electronic data reduction is used for several of the more complex analytical systems (GC and GC/MS). Analysts are required to review the electronic data processing for accuracy and consistency with the appropriate data reduction techniques. Some electronic data reduction can result in incorrect integrations by the analytical system. In these instances the analysts are permitted to manually override the computer in order to correct the inappropriate integration. Examples of this may be integration of an incorrect peak, errors in calculation, or misplacement of baseline in the peak integration. When manual overrides of the computer generated data is necessary, analysts shall document the action taken and the reasons for the manual override with the concurrence of the supervisor or lab director, along with their initials. Manual override actions shall only be performed to correct inaccuracies and shall be done in accordance with sound analytical procedures.

18.5 Formulae and Calculations

18.5.1 All final results are calculated using the formula specified in the method. The table 18.6 below contains the most frequently used calculations from the methods.

18.5.2 Results are converted to the appropriate reporting units as in the tables below, but other reporting conventions (i.e., wet weight instead of dry weight) can be substituted, as required, and shall be clearly identified on the final reports with justification as needed.

18.5.3 Final results are rounded to an appropriate number of significant figures (2-3 significant figures). If the digit 6, 7, 8, or 9 is dropped the preceding digit is increased by one. The preceding digit is not altered if the digit is less than 5. When the digit to be dropped is 5, the preceding digit is rounded to the nearest even number. (1.25

Controlled Document

becomes 1.2 and 3.35 becomes 3.4). Refer to SOP *Data Reduction, Validation and Reporting*, Table 1.1, for general reporting units.

18.5.4 Components detected in blanks are reported. Blank concentrations are not subtracted from any associated sample data unless required by the method.

18.6 Summary of Equations Used in Calculations

SUMMARY OF EQUATIONS USED IN CALCULATIONS

Equations

BN/A Extractable by GC/MS [Internal Standard Method (625 & 8270)] — **Liquid µg/l (or mg/L)** — **Solid µg/Kg (or mg/Kg)**

$$\text{Relative Response Factor (RRFs)} = \frac{AX \times CIS}{AIS \times CS}$$

AS = area of standard (area counts)
AIS = area of internal standard (area counts)
CIS = concentration of internal standard (µg/ml)

$$\text{Water conc. (µg/L)} = \frac{AS \times CIS \times Vf}{AIS \times RRFS \times Vi} \times DF$$

DF = dilution factor
Vf = final extract volume
Vi = initial sample volume extracted (L)

$$\text{Soil Conc. (µg/kg)} = \frac{AS}{AIS} \times \frac{CIX}{RRFS} \times \frac{Vf}{Wspi} \times \frac{1}{(\%\ \text{solids} \times 0.01)} \times DF$$

Wspl = Weight of sample (Kg)

18.7 Data Transfer to LIMS or Computer Programs

18.7.1 Analytical results are entered on the worksheets associated with the samples after initial review by the analyst and/or a peer, or, in some cases, can be directly transferred from the instrument to the computer program or LIMS. Approval reports can be generated from the LIMS or approval is noted on the worksheet. Data is then checked for errors and anomalies.

18.8 Validation Documentation Checklists

18.8.1 Data Review

18.8.1.1 The field sampling manager, lab director or project manager is responsible for reviewing all field data and that all field descriptions, field calibrations, field measurements and specifications have been met prior to entering any data into laboratory worksheets.

18.8.1.2 It is the responsibility of the analyst to initially review the raw data. The analyst in most cases follows a checklist to begin the data validation process. The analyst validates that the analytical system is in control and initially calculates and reviews the data for errors (refer to Operator Data Validation form below). An initial check for obvious data quality is performed (surrogates, duplicates, and spikes). Early detection of quality problems helps to ensure that the final data product is the best that Micro-Methods can produce. The data is then distributed to the supervisor or lab director for review. Prior to entering any data into the LIMS or computer program, the raw data is reviewed and signed to ensure that methods or standard operating procedures have been followed, that initial quality indicators are acceptable, that precision and requirements are met, that preparation logs and instrument logs are complete, and all the required analyses are completed as requested or required. If any known problem exists with the data, it is the responsibility of the analyst and/or supervisor to notify the lab director and the QAO through a written non-conformance report, followed by a corrective action report.

Controlled Document

18.8.1.3 All documentation and forms used in the review and validation process are maintained with the raw data and hardcopy of the report for 7 years following final submission of the report.

Operator Data Validation Requirements for 8270/625 Methods

OPERATOR
DATA VALIDATION REQUIREMENTS FOR 8270/625 METHODS
(REQUIRED EVERY 12 HOURS)

DATE _____ Analyst_____
METHOD _____ Instrument _____

1. Did the Instrument meet DFTPP tune criteria before samples were analyzed?
   YES / NO File # _____
   No Explain _____

2. Did the Continuing Calibration Check meet the method-required criteria?
   Date of 5 pt. Daily calibration check file #
   Are SPCC's greater than the minimum required by the method? YES / NO
   Are CCC's less than the maximum allowed by the method? YES / NO

3. Were all samples in this group within the calibration range or diluted to be in range?
   YES / NO

4. Are all semi-volatile surrogates within the methods stated limits or the laboratory established limits? YES / NO

5. Are all samples within the RT requirements & area abundance requirements? YES / NO

6. Does this group of samples meet the holding time requirements? YES / NO
   If No listed samples and explain _____
   _____
   If No were these samples flagged as estimated concentrations? YES / NO

7. Were any samples run outside the 12-hou periods? YES / NO
   If yes, list samples run outside of 12-hou periods? _____
   Corrective action _____

8. Was a blank run during the 12-hour period? YES / NO
   Was any target compounds detected above the detection limit in the associated blank?
   YES / NO
   List any compounds detected in the blank_____

   List samples associated with the blank is positive hits are detected in both sample & blank.
   _____
   What corrective action was taken? _____

9. Is peak resolution acceptable in these samples? YES / NO
   Note any problems with peak coelution, gross amounts of non-target contaminants, or any possible Chromatography problems suspected.
   _____

10. Were results checked for errors in data transfer and calculations? YES / NO
    Every result? YES / NO Random checks? YES / NO

11. Was a QC check sample or a matrix spike analyzed during the 12 hours? YES / NO
    File #_____ were any results outside the control limits? YES / NO

12. Were duplicates or matrix spike duplicates analyzed during the 12-hour period? YES / NO

Controlled Document

File # _____

13. Were the results checked for false positives or negatives? YES / NO How?

18.9 Data Integrity

18.9.1 Data integrity involves checking all field and laboratory data entries and calculations for errors and mistakes. It also involves review of all documentation to assure that sample ID numbers are correct and includes a review that the samples have been analyzed within appropriate holding times.

18.9.2 The supervisor or lab director performs all data integrity checks or a peer not involved in the original analysis or data reduction process. Raw data is checked for transcription errors and calculation errors (refer to Data Integrity Review form below), for completeness and acceptability. If the data is found to be acceptable, it is then distributed to the Quality Assurance Officer for review.

18.9.3 The QAO shall randomly select a percentage of data packages for systematic review reverse tracking from the final report data back through the analytical process to sample login and to sample custody.

18.9.4 All anomalies discovered by the QAO shall be compiled into a report, corrective actions implemented, and clients notified and reports revised as required.

Controlled Document

18.10Data Validation

18.10.1Routine data validation is accomplished by following a series of checks and reviews, which are intended to give assurance that the reported results are of a verifiable and acceptable quality. Most of these tasks are performed by the QAO, a lab supervisor or lab director not actively involved with generating the data (refer to QC Review below). In addition to the checklist example, refer to SOP *Data Reduction, Validation and Reporting)* .

18.10.2When required data is validated using checklists based on *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review* and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review.* Refer to SOP *Organics Data Quality Audit Checklist DCN: 169.*

18.11 Data Reporting

18.11.1Data Qualifier Codes (Data Flags)

18.11.1.1 Data flags are used on reports as needed to inform the data interpreters and users of any additional or pertinent information that would assist in clarification or enhancement of the data. The data flagging system is shown in below which is similar to the flags used in the CLP protocols, but contains additional flags for field use. Additional qualifiers may be added to the list to explain anomalies more clearly. Case narratives are written for anomalies, and to verify the data quality. Each laboratory supervisor is responsible for compiling the information for the respective part of the narrative. The following data qualifiers shall be the basis of the symbols used in the reports. Other qualifiers shall be added to this list to provide more clarification.

18.11.1.2 Any data that is reported below the lower limit of quantitation shall be considered to have an increased quantitative uncertainty and shall be reported using defined qualifiers or flags or explained in the case narrative.

18.11.1.3 To be valid data the raw results must be bracketed by the calibration range. When the analysis exceeds the calibration range, the sample shall be appropriately diluted such that the diluted result is in the upper half of the calibration range. The results and reporting limits shall reflect the dilution and a qualifier shall be associated with the diluted results. In the event that data must be reported that exceeds the calibration range, qualifiers shall accompany the affected results with and explanation in the narrative. This type data shall be considered to have a greater quantitative uncertainty and shall be reported as having a greater quantitative uncertainty (estimated value, suspect result, etc,...)

U—Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10 U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to

Controlled Document

10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to

$\frac{(330\ U)}{D}$ X dilution factor Where $D = \frac{100 - \%\ moisture}{100}$

For example, at 24% moisture, $D = \frac{100 - 24}{100} = 0.76$

$\frac{(333\ U)}{0.76}$ X 10 = 4382 U Round to 4400 for 2 significant figures

J—Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1 : 1 response is assumed, or when the mass spectral data indicate the presence of a compound that meets the identification criteria but the result is less that the sample quantitation limit but greater than zero. For example, if the sample quantitation limit is 10 ug/L, but a concentration of 3 ug/L is calculated, report it as 3 J. The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N—Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds, where the identification is based on a mass spectral library search. It is applied to all TIC results.

P—This flag is used for a pesticide/Aroclor target analyte when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported and flagged with an "P".

C—This flag applies to pesticide results where identification has been confirmed by GC/MS. If the GC/MS confirmation was unsuccessful, do not apply this flag, instead use a laboratory-defined flag.

B—This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank

Controlled Document

contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified target compound.

E—This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale, the sample or extract must be diluted and re-analyzed. All such compounds with a response greater than full scale should have the concentration flagged with an "E" for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported.

D—This flag identifies all compounds in an analysis at a secondary dilution factor. If a sample or extract is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the report for the diluted sample, and all concentration values reported are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A—This flag indicates that a TIC is a suspected aldol-condensation product.

X—Other specific flags may be required to properly define the results. If used, they must be described fully, and such description attached to the report. Begin by using "X". If more than one flag is required, use "X" and "Y", as needed. For instance, the "X" flag might combine the "A", "B", and "D" flags for a sample. The laboratory defined flags are limited to the letters "X", "Y", and "Z".

The combination of flags "BU" or "UB" is expressly prohibited. Blank contaminants are flagged "B" only when they are detected in the sample.

Controlled Document

18.11.1.4 When performing work in the state of Florida, the following qualifiers shall be used:

DATA QUALIFIER CODES
******To Be Used in the State of Florida and where Applicable**

SYMBOL	MEANING
A	Value reported is the mean (average) of two or more determinations. This code shall be used if the results of two or more discrete and separate samples are averaged. These samples shall have been processed and analyzed (e.g. laboratory replicate samples, field duplicates, etc.) independently. Do not use this code of the data are the result of replicate analyses on the same sample aliquot, extract or digestate. Under most conditions, replicate values shall be reported as individual analyses.
B	Results based upon colony counts outside the acceptable range. This code applies to microbiological tests and specifically to membrane filter colony counts. The code is to be used if the colony count is generated from a plate in which the total number of Coliform colonies EXCEEDS the method indicated ideal ranges that are: Total Coliforms: 20 - 80 colonies Fecal Coliforms: 20 - 60 colonies
F	When reporting species: F indicates female sex.
H	Value based on field kit determination; results may not be accurate. This code shall be used if a field screening test (i.e. field gas chromatograph data, immunoassay, vendor-supplied field kit, etc.) was used to generate the value and the field kit or method has not been recognized by the Department as equivalent to laboratory methods.
J	Estimated value; value not accurate. This code shall be used in the following instances: 1. surrogate recovery limits have been exceeded; 2. no known quality control criteria exists for the component; 3. the reported value failed to meet the established quality control criteria for either precision or accuracy; 4. the sample matrix interfered with the ability to make any accurate determination; or

Controlled Document

5. the data is questionable because of improper laboratory or field protocols (e.g. composite sample was collected instead of a grab sample).

Note: 1. A "J" value shall be accompanied by justification for its use.

2. A "J" value shall not be used if another code applies (ex. K, L, M, T, V, Y, PQL)

K Off-scale low. Actual value is known to be less than the value given. This code shall be used if:

1. The value is less than the lowest calibration standard AND the calibration curve is known to be non-linear; or
2. The value is known to be less than the reported value based on sample size, dilution or some other variable.

This code SHALL NOT be used to report values that are less than the laboratory practical quantitation limit or laboratory method detection limit.

L Off-scale high. Actual value is known to be greater than value given. To be used when the concentration of the analyte is above the acceptable level for quantitation (exceeds the linear range or highest calibration standard) AND the calibration curve is known to exhibit a negative deflection.

M When reporting chemical analyses: presence of material is verified but not quantified. The reported value shall be the laboratory practical quantitation limit. This code shall be used if the level is too low to permit accurate quantification, but the estimated concentration is GREATER THAN the laboratory method detection limit. If the value is less than the method detection limit, use "T", below. When reporting Oxygen Reduction Potential or Temperature: indicates a negative value When reporting Species: indicates male sex.

N Presumptive evidence of presence of material. This qualifier shall be if:

1. the component has been tentatively identified based on mass spectral library search;
2. if the presence of the analyte is indicated but there is evidence of possible interferences; or
3. there is an indication that the analyte is present, but quality control requirements for confirmation were not met (i.e. presence of analyte was not confirmed by alternate procedures).

Controlled Document

O Sampled, but analysis lost or not performed. Note: if reporting data to STORET, a numerical value must be entered. Such values are not meaningful and shall not be used.

Q Sample held beyond the accepted holding time. This code shall be used if the value is derived from a sample that was prepared and/or analyzed AFTER the approved holding time restrictions for sample preparation and analysis.

T Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and SHALL NOT be used in statistical analysis.

U Indicates that the compound was analyzed for but not detected. This shall be used to indicate that the specified component WAS NOT detected. The value associated with the qualifier shall be the laboratory method detection limit. Unless requested by the client, less than the method detection limit values shall not be reported (see "T" above).

V Indicates that the analyte was detected in both the sample and the associated method blank. Note: the value in the blank shall not be subtracted from associated samples.

Y The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.

Z Too many colonies were present (TNTC), the numeric value represents the filtration volume.

PQL The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

REJ Data is rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.

NAI Not analyzed due to interference.

Controlled Document

If more than one code applies, and the data is to be entered into STORET, only one code shall be reported. The code shall be selected based on the following hierarchy:

REJ
NAI, O
Y
V
H
J
B, K, L, M, PQL, T, Z
A

The following codes deal with certain aspects of field activities. The codes shall be used IF the laboratory has knowledge of the specific sampling event. The codes shall be added by the organization collecting the sample, if they apply:

D Measurement was made in the field (i.e. in situ). This applies to any value (ex pH, specific conductance, etc.) that was obtained under field conditions using approved analytical methods. Note: when data is to be entered into STORET, and the parameter code specifies a field measurement (e.g. "Field pH"), this code is not required.

E Indicates that extra samples were taken at composite stations.

R Significant rain in the past 48 hours. This code shall be used when the rainfall might contribute to a lower than normal value.

HIS Data deviates from historically established concentration ranges.

18.11.2Laboratory Data Reports

18.11.2.1 All parties involved with the data review and validation process are responsible for providing data entry operators or clerical staff with accurate records for transcription. The Data Manager (office manager or clerical staff) assembles and prints the report, then distributes the report to the Laboratory Director for final review. The Lab Director reviews and, if the data is acceptable, signs the report and releases the report to the client. Custom reports and project specific data deliverables can also be provided to meet the specific needs of the client.

Controlled Document

18.11.2.2 Case narratives discussing the quality control issues shall be written and shall be part of the final report. The narrative shall include any deviations from (such as failed quality control), additions to or exclusions from the test method (such as environmental conditions), and any non-standard conditions that may have affected the quality of results. A list of data qualifiers shall be attached to explain the use of any data qualifiers. Opinions and judgments shall be clearly noted as well as the basis upon which the opinions and judgments are made.

18.11.2.3 Final reports shall be entitled "Laboratory Results". The report shall include the name, address, and phone number of the Laboratory. The report shall also designate a contact. Each report shall have a unique lab file number. Pages shall be numbered in the form of page X of Y (example: 2 of 15). The report shall contain the name and address of the client and if available, the project name. The sample shall contain a description and a unique laboratory ID number, including any client identification number. The report shall include the date of sample receipt, date and time of collection, date of analysis, and the date and time of sample preparation and/or analysis if the required holding time for either activity is less than or equal to 72 hours. The report shall contain the test method used. When the laboratory collects the sample a reference to the sampling procedure shall be included. The report shall include measurements, examination and derived results, supported by appropriate documentation, noting any failures. Results shall reflect the units and dry or wet weight calculations. The report shall contain the name of the statistical package used to provide data. The report shall include an approved signatory and title of the person accepting responsibility for the content of the report as well as the date of issue of the report. The report shall contain a statement that the results relate only to the items tested or to the sample received by the laboratory and shall contain a statement that the report shall not be reproduced except in full, without the written approval of the laboratory. The final report shall include QA/QC data and also acceptance limits. When test data is provided by outside sources, such as subcontracted laboratories, the data shall identify the subcontractor and the data. The subcontractor's report shall be attached to the final report and shall provide clear identification of numerical results with values

Controlled Document

outside of quantitation limits. Subcontractors shall submit hard copy reports. In the event subcontractors are requested to submit a report electronically, the subcontractor shall be subject to all of the confidentiality requirements established in Chapter 4 of the QAM.

18.11.2.4 Amendments to reports shall be marked as "Amendments'. Amendments following issuance of a report shall be entitled "Revisions". Changes or corrections to a report shall be title "Revision". All changes to the reports shall meet the requirements of the NELAC standards. All amendments and revisions to reports shall reference the original report in the cover letter.

18.11.2.5 Errors detected in reports or LIMS data will be tracked using the following form:

18.12Final Report Authorization

18.12.1All final reports will be authorized for release by the Lab Director on the cover page. In the event that the Lab Director is unable to perform this duty, one of the approved signatories from section 2.1.1.1 of this manual may authorize the report for release.

Controlled Document

19.0 NON-CONFORMANCE AND CORRECTIVE ACTION

19.1 Definition of Non-Conformance

19.1.1 American National Standard ANSI/ASQC E-4-1994 Specifications and Guidelines for Quality Systems for Environmental Data collection and Environmental Technology Programs defines non-conformance as a deficiency in characteristic, documentation, or procedure that renders the quality of an item or activity unacceptable or indeterminate; non fulfillment of a specified requirement. When a non-conformance is discovered or suspected the occurrence is reported immediately. The QAO and/or Lab Director or designees are responsible for reviewing the circumstances of nonconformity to determine what corrective action should be taken. Non-conformance Event Review Report is initiated by the investigator (refer to Figure). The analyst or technician generally fills out the first 6 entries. The QAO and/or the Lab Director will complete the form. This form is used as the documentation for non-conformities. The QAO and/or Lab Director will take all steps necessary to prevent repetition of non-conformities.

19.2 Corrective Action Process

19.2.1 Once the non-conformity has been identified, the QAO or Lab Director will initiate a Corrective Action Request. Corrective action can be divided into two types:

1) Immediate . . . to correct or repair non-conforming data or equipment.

2) Long term . . . to eliminate causes of non-conformance and take measures to verify that they do not recur.

19.2.2 The status of all corrective actions are tracked in a Corrective Action Request Master Log when more than one CAR is processed at a time.

19.2.3 Summaries of the CARs and NCERRs are prepared from the CARML annually, or as needed, to be evaluated for effectiveness of the corrective action. This task is assigned to the QAO and/or Lab Director.

Controlled Document

Maintenance of the Corrective Action Request Master Log is the responsibility of the QAO.

19.2.4 The Table Below (also refer to SOP *Corrective Actions*) summarizes the quality control checks and acceptance criteria and the recommended corrective action for most of the analytical and QC activities in place.

19.2.5 19.11 contains a CAR specific for Quality issues and applies to most of the routine QC out of specification results.

19.3 Quality Control Measures and Acceptance Criteria

19.3.1 The table below identifies each of the quality control checks that are required by test methods, regulatory bodies and/or Lab acceptance criteria. The acceptance range criteria or the source of the acceptance range is identified. Quality Control Limits and Acceptance range criteria will be evaluated for effectiveness and updated from the LIMS system using 25 sample points and annually at minimum for the routine test procedures. Data usability is derived from acceptable and reliable control procedures. For analytical procedures that have no established acceptance/rejection criteria or required by the procedure that the laboratory generate the control limits, the criteria will be derived from spiking a minimum of 4-7 (preferred 25) samples of the same matrix, then entering the results into the LIMS and generating control limits based on +/- 3 Standard Deviations from the mean, then updating annually or whenever there exists enough data to warrant the criteria change. If 4 –7 samples cannot be spiked to determine the criteria, substitute Lab Reagent Water or Sand as the matrix and establish Lab Controls. In some complex matrices, it may be difficult to establish limits that would be considered reliable. If 4-7 samples cannot be spiked, default method control limits will be used until such time as more representative controls can be generated. If no method control limits exist the range of 50%-150% can be used. Sample Narratives must accompany the data. Use Flags when necessary.

19.4 Identifying and Assessing QC Measures (Responsibility Designation)

19.4.1 Generally, several individuals review quality control information. The responsibility for the initial assessment of a quality control measure lies with the individual who (1) identifies the sample or procedure as a QC measure; and (2) has access to the test results.

Controlled Document

19.4.2 The individual responsible for operating the analytical instrument or equipment must be responsible for assessing the following applicable QC Measures:

1. Method, reagent and calibration blanks
2. Calibration integrity: initial and continuing calibration, interference standards, and QC check standards
3. System performance checks
4. Tuning criteria
5. Surrogate and internal samples
6. Titrating solutions

19.4.3 The following checks are normally assessed by a secondary reviewer (supervisor, lab director, or QAO) but may be evaluated by the primary analyst:

1. Standard Reference Material
2. QC Check Samples
3. Spiked samples (matrix and blank)
4. Duplicates

19.4.4 The following must be assessed by the field supervisor or individual(s) responsible for sample collection, but may be reviewed by laboratory personnel if the sample has been identified as:

1. Precleaned and field cleaned equipment blanks
2. Trip blanks
3. Field collected duplicates
4. Split samples

19.5 Determining the Source of QC Problems

19.5.1 Once a problem has been identified, the process (whether analytical or review) should be halted until the reason for the problem has been identified. Finding the source of a QC problem involves identifying probable sources of error, and checking each source to determine if the protocols were properly followed. Common sources of error and expected follow-up protocols are outlined on Table 1-2. Usually, the individual who is responsible for identifying the problem is responsible for determining the cause. However, other personnel and organizations may need to cooperate.

Controlled Document

19.6 Initiating Corrective Action

19.6.1 When the source of a QC error has been identified, appropriate steps must be taken to eliminate or minimize recurrences.

19.6.2 If a QC measure listed in section 3 above is not acceptable, testing cannot continue until the QC check meets specifications. Corrective actions should be initiated:

1. By the individual who is operating the instrument; or
2. By an individual in oversight authority (i.e. supervisor, lab director, or QAO) if a solution is not immediately apparent.

19.6.3 The individual who identifies the problem must initiate corrective actions for QC measures above. The individual must initiate a Corrective Action Form and distribute it to the relevant section or individual. The completed CA Form will be returned to the QAO to receive a corrective action request # and to be logged in the Master Log.

19.7 Documentation and Notification of Affected Parties

19.7.1 If a quality control measures fails to meet acceptance criteria, the QC measure, and the procedures were used to correct the problem must be documented.

19.7.2 The responsible person initiates documentation. Corrective actions that are initiated during an on-going analytical run may be documented on the chromatogram, integrator or strip chart recorder records as well as in the instrument, analytical and/or field logs.

19.7.3 Corrective actions that require input or intervention of more than one individual must at a minimum be documented in the related logs and records. Corrective action forms for larger organizations are recommended.

19.7.4 If more than one organization is involved with identifying a QC problem and the associated corrective actions, formal memos are recommended, although dated and signed phone logs are acceptable. In all cases, a copy of all documentation must be maintained in the project files.

19.7.5 Corrective action documentation must either be through the Corrective Action Form DCN 063 or in bound lab notebooks. The Corrective Action Form is preferred because of ease of use.

Controlled Document

19.7.6 If an identified quality control problem affects more than one set of data or multiple projects, the documentation associated with identifying and resolving the problem must be cross referenced to all associated projects.

19.7.7 All parties affected by out of control data will be contacted by phone or email as soon as possible, followed by written notification and explanation in the narrative of the data that is out of control. This also applies to data found to be out of control during data audits and any event such as the identification of defective measuring or test equipment that casts doubt on the validity of results given in any test report or test certificate or amendment to a report or certificate.

19.7.8 All corrective action reports, audits and audit responses shall be retained for 7 years following final submission or completion.

19.8 Corrective Actions from External Sources

19.8.1 The need to initiate corrective action may be the result of activities or audits from external sources. Sources include systems audits; performance audits; split samples; blind QC samples; and findings from project or data validation review.

19.8.2 In all cases where the need for corrective action as a result of a third party audit, the recommended corrective actions must be initiated and accomplished within the time frame agreed on between the auditing body and Micro Methods management.

19.9 Correcting Transcription Errors

19.9.1 **Make no Erasures to data.**
Do not overwrite data.
Do not obliterate data.
19.9.2 Draw a single line using blue or black ink through the mistake or error in the Log Book, or other document.
19.9.3 Record the change.
19.9.4 Initial or sign the change.
19.9.5 Date the change.
19.9.6 Record the reason for the change where clarification is needed.

Controlled Document

19.10 Correcting Errors in the LIMS

19.10.1. Log in to the computer using your access name and password.
19.10.2Access the sample results analysis.
19.10.3Change the result.
19.10.4Save the result.
19.10.5Give the reason for the change in the comments boxes if clarification or additional info is needed.
19.10.6For other computer files change the result and change the revision number. In the DCN master log record the reason for the change.

Controlled Document

19.14 Routine Corrective Actions

19.14.1 Acceptance Criteria and Corrective Actions for Quality Control Checks

QC CHECK	ACCEPTANCE CRITERIA
BLANKS	
Method blank	<MDL
Reagent blank	
Calibration blank	
Precleaned Equipment Blanks	
Field Cleaned Equipment Blanks	
Trip Blanks	
CALIBRATION	
Initial calibration	a. Method acceptance criteria* b. SOP acceptance criteria
QC Check Standard	a. Method acceptance criteria* b. +/- 10% of true value c. Internally generated control limits
Continuing calibration	a. Method acceptance criteria calibration* b. +/- 20% deviation from initial calibration c. Internally generated control limits
Interference standard	Method acceptance criteria
Tuning criteria	Method acceptance criteria
SYSTEM PERFORMANCE CHECKS	
Pesticide	Method acceptance criteria
Standard Reference Materials	Within certified limits
QC Check Samples	Within specified limits

- Method acceptance criteria shall be followed. If none is provided, the criteria (b) or internal, historically generated control limits (c) shall be used.

Controlled Document

SPIKES	
Matrix Spike	Within range specified by QAM (accuracy acceptance limits)
Blank Spike	Within method specified criteria
DUPLICATES	
Laboratory Duplicates	Within range specified by QAM , Method or Lab Generated Data established precision acceptance limits)
Matrix Spike Duplicates	Within range specified by QAM , Method or Lab Generated Data established precision acceptance limits
Field Duplicates	Within range specified by QAM , Method or Lab Generated Data established precision acceptance limits
OTHERS	
Surrogate Standards	Calculated from Lab Generated Data
Internal Standards	Method acceptance criteria
Split Samples	Meets precision Lab Generated acceptance criteria
Titrating Solutions	a. +/- 10% of expected (lab determined) value b. Replicate sample aliquot results are within method specified limits
MICROBIOLOGY	
Monthly parameters	Per Section 17.8.6 QAM
Chlorine Residual	Per Section 17.8.6 QAM
Conductivity	Per Section 17.8.6 QAM
Heterotrophic Count	Per Section 17.8.6 QAM
Annual metals concentration	Per Section 17.8.6 QAM
Distilled water suitability test	Per Section 17.8.6 QAM

Controlled Document

Incubators	35 +/-0.5 C or 44.5 +/-0.2 C
Duplicates	Within calculated precision criteria generated by Lab data
Morphological and Biochemical Confirmation	Per Table IV-A-5 of EPA-600/8-78-017
Positive and negative media controls	Per Table IV-A-4 of EPA-600/8-78-017
MF Blanks	<1
MPN dilution blanks	<1
Inhibitory residue	Must meet method criteria

MICROBIOLOGY

Membrane Filter Analysis	Verified colonies must be Coliforms
MPN Analysis	Verified colonies must be Coliforms

19.14.2 Probable Sources and Expected Corrective Actions

1. **BLANKS**
   a. Sources and expected review procedures:
      1. Contaminated reagents - verify reagent sources
      2. Environmental Contamination (all sample collection, sample and analysis conditions) - review sampling handling protocols
      3. Improper or incomplete laboratory and/or field decontamination/cleaning procedures - review cleaning protocols
      4. Contaminated sample containers - verify source and storage conditions
      5. Contaminated source water - verify water source
   b. Expected Corrective Actions:
   1. When results of the analysis of the laboratory blank exceeds the reporting limit, cease the related analysis, and review data with respect to reported contamination levels. If sample concentrations are near the reported blanks levels, reprocess (re-extract or

Controlled Document

digest) associated samples or call for resample. If sample concentrations or the reporting levels are significantly higher than blanks, or contaminants are not detected in the samples, report the sample data and concentrations in blank. Flag results in blank. In the event no resample can be performed, contact the client, then report the results with appropriate data flags.

2. Take measures to eliminate future problems: discard reagents, revise protocols, perform preventative maintenance on system, adjust use of interfering chemicals (solvents, fuels, etc.).

2. CALIBRATION

a. Sources and expected review procedures:
   1. Improperly prepared or outdated standards - review preparation logs for calculation/dilution errors and use of expired sources.
   2. Improperly prepared or outdated check standard - verify check standard
   3. Poor instrument response - determine if preventative maintenance is required
   4. Incorrect calculations - review and verify all calculations
   5. Contamination problems (see blanks above)

b. Expected Corrective actions for initial calibrations:
   1. Recalculate calibration curve
   2. Prepare fresh standards
   3. Recalibrate instrument
   4. Perform preventative maintenance
   5. Perform mass calibration and retune
   6. Reanalyze all samples bracketing those from previous ACCEPTABLE QC check through next acceptable QC check.
   1. Take measures to eliminate sources of contamination

c. Expected Corrective actions for continuing calibration criteria failure:
   1. In the event that the continuing calibration verification fails, cease all analyses related to the calibration. Investigate the problem and correct the problem. Analyze two consecutive acceptable calibration verifications or analyze another set of initial calibration standards, verify and proceed with the analysis.
   2. Do not report data that has been analyzed following a failed continuing calibration verification. Investigate and correct the problem, then reanalyze if necessary.

3. SYSTEM PERFORMANCE CHECKS

a. Sources and expected review procedures:
   1. Pesticides:
   Poor column performance - replace/repack column

Controlled Document

2. Standard Reference Materials and QC Check Samples:
   a. Improper sample preparation or analysis - review all protocols associated with sample preparation and analysis
   b. Incorrect dilutions or calculations - recheck all calculations
   c. Contamination (see blanks above)

b. Expected Corrective Actions:
   1. Reanalyze all samples bracketing those from previous ACCEPTABLE QC check through next acceptable QC check

SYSTEM PERFORMANCE CHECKS, Expected Corrective Actions
   1. Reprocess all samples associated with QC check sample or standard reference material (unless the problem is unique to processing of the check sample)
   2. Take measures to eliminate sources of contamination

4. SPIKES

a. Sources and expected review procedures:
   1. Error in calculation - review/recheck all calculations
   2. Error in preparing or using spike solutions - review all preparation and/or analytical logs including sample preparation) for proper dilutions, solvents, buffers, etc.
   3. Outdated standards - review expiration dates and standard preparation logs
   4. Contamination problems (see blanks above)
   5. Poor instrument response - determine if preventative maintenance is required

b. Expected Corrective Actions:
   1. Take measures to eliminate contamination problems, reprocess if necessary
   2. Perform required maintenance and revise pm schedules
   3. Review preparation, calculation and record keeping to determine if additional training or more stringent protocols are needed
   4. If the laboratory has no historical data to show that the sample matrix produces consistently unacceptable (out of control) recoveries, and none of the sources discussed above are responsible for the problem, the sample must be reprocessed and reanalyzed. If reanalysis produces the same result, associated samples should be reported with qualified results. If results are different, all associated samples must be reprocessed for analysis.

5. DUPLICATES

a. Sources and expected review procedures:
   1. Non representative sample - review sample collection and/or sample processing protocols
   2. Error in calculations - recheck calculations
   3. Contamination problems (see blanks above)

Controlled Document

4. See matrix spikes above

b. Expected Corrective Actions:
   1. Report data with qualifiers and explanation
   2. Revise sample collection/sample processing protocols to assure a representative sample
   3. Takes measures to eliminate contamination problems.
   4. Reprocess and reanalyze sample set (if laboratory generated replicate).

6. SURROGATE SPIKES

a. Sources and expected review procedures:
   1. See 4.a above

b. Expected Corrective Actions:
   1. See 4.b above

7. INTERNAL STANDARDS

a. Sources and expected review procedures:
   1. See 4.a above

b. Expected Corrective Actions:
   1. See 4.b above
   2. Reanalyze samples from last acceptable QC check to next acceptable QC check

8. SPLIT SAMPLES

a. Sources and expected review procedures:
   1. See 5.a above

b. Expected Corrective Actions:
   1. See 5.b above

9. TITRATING SOLUTIONS

a. Sources and expected review procedures:
   1. Error in calculation - review/recheck all calculations
   2. Error in preparing or using titrant and standard solutions - review all preparation and/or analytical logs (including sample preparation) for proper dilutions, solvents, buffers, etc.
   3. Outdated standards and/or - review expiration dates and standard preparation logs
   4. Contamination problems (see blanks above)
   5. Non representative sample - review sample collection and/or sample processing protocols
   6. Indistinct or inconsistent endpoint readings

b. Expected Corrective Actions:
   1. Take measures to eliminate contamination problems, reprocess if necessary

Controlled Document

2. Review preparation, calculation and record keeping to determine if additional raining or more stringent protocols are needed
3. If replicate analyses are not acceptable, titrate additional aliquots
4. Reanalyze samples from last acceptable QC check to next acceptable QC check
5. Train analysts to titrate to consistent endpoint

10. MICROBIOLOGY - MONTHLY PARAMETERS, METALS, WATER SUITABILITY

a. Sources and expected review procedures:
   1. Deionizer/Water not functioning properly
b. Expected Corrective Actions:
   1. Clean, replace cartridges and/or perform other preventative maintenance tasks
   2. Reanalyze water
   3. Reprocess samples (if still within holding times) or resample

11. MICROBIOLOGY - AUTOCLAVE

a. Sources and expected review procedures:
   1. Autoclave not functioning properly
b. Expected Corrective Actions:
   1. Perform preventative maintenance and resterilize

12. MICROBIOLOGY - INCUBATORS

a. Sources and expected review procedures:
   1. Incubator not functioning properly
   2. Thermometers or recording devices not functioning properly
b. Expected Corrective Actions:
   1. Perform preventative maintenance on devices, recalibrate if necessary
   2. Reprocess samples (if still within holding times) or resample

13. MICROBIOLOGY - DUPLICATES

a. Sources and expected review procedures:
   1. Counting errors or difficulties in identifying Coliform organisms (membrane filter).
   2. Nonrepresentative sample.
   3. Contamination problems.
b. Expected Corrective Actions:
   1. Recount or re-examination colonies to determine counting error or misidentifications.
   2. Examine blanks and samples analyzed to determine possible sources of contamination.

Controlled Document

3. If 14.a.2 above is found to be the problem, or the problem has not been identified, data must be invalidated and resampling and retesting must occur.

14. MICROBIOLOGY - ATCC AND BIOCHEMICAL CONFIRMATION

a. Sources and expected review procedures:
   1. Media prepared improperly (incorrect pH, sterilized too long, etc.).
   2. Incorrect incubator temperatures.
   3. Media shelf life has expired and no longer functions properly.

b. Expected Corrective Actions:
   1. Isolate problem with media preparation.
   2. Confirm proper incubator temperatures.
   3. Prepare new batch of media from the same lot to determine media acceptability or discard media if the shelf life has expired.
   4. Prepare new media from a different lot number.
   5. Invalidate all affected data linked to the media that was not functioning acceptability.

15. MICROBIOLOGY - POSITIVE AND NEGATIVE MEDIA CONTROLS

a. Sources and expected review procedures:
   1. See 14.a.1-3 under ATCC or biochemical confirmation.
   2. Samples used were not positive or negative.
   3. Improper analytical protocol.
   4. Contamination problems (negative control).
   5. Colony misidentification.
   6. Stressed organisms that did not respond in a typical fashion.

b. Expected Corrective Actions:
   1. See 15.b.1-4 under corrective actions for ATCC or biochemical confirmation.
   2. Re-examine response for misidentifications.
   3. Use alternate positive and negative control samples to confirm media response and check on original samples.
   4. Invalidate data and retest if problem was with the media or testing system.

16. MICROBIOLOGY - MF BLANKS

a. Sources and expected review procedures:
   1. Equipment or rinse water/dilution water improperly sterilized.
   2. Rinsing technique not adequate.
   3. Contamination problems.

b. Expected Corrective Actions:
   1. Review sterility checks on the autoclave for rinse/dilution water and other associated equipment.

3. Evaluate rinsing protocols between samples.

Controlled Document

Review testing procedures and test location for other sources of contamination. Reject data and resample

17. MICROBIOLOGY - MPN DILUTION BLANKS

a. Sources and expected review procedures:
   1. Equipment or dilution water not properly sterilized.
   2. Contamination problems during test procedure.

b. Expected Corrective Actions:
   1. Review sterility checks on the autoclave for dilution water and other sterilized equipment.
   2. Review testing procedures and location for possible sources of contamination.

18. MICROBIOLOGY - INHIBITORY RESIDUE TESTS

a. Sources and expected review procedures:
   1. Detergent residues inhibit bacterial growth.
   2. Alternate rinsing practice alleviates the problem.

b. Expected Corrective Actions:
   1. Implement rinsing protocols that produce an acceptable inhibitory residue test.
   2. Change detergents to one that produces an acceptable test result under normal rinsing operations.

19. MICROBIOLOGY - MEMBRANE FILTER VERIFICATION

a. Sources and expected review procedures:
   1. Compare original counts against verified colony counts.

b. Expected Corrective Actions:
   1. Adjust initial colony count based upon positive verification percentage and report as verified Coliform count.

20. MICROBIOLOGY - MPN COMPLETED TESTS

a. Sources and expected review procedures:
   1. Compare original results against completed test results.

b. Expected Corrective Actions:
   1. Adjust original MPN result calculated from the completed test results.

Controlled Document

20.0 QUALITY ASSURANCE REPORTS TO MANAGEMENT

20.1 The QAO is responsible for scheduling and providing quality assurance reports to Management or clients and auditors. The report includes at a minimum the following where applicable:

20.1.1 Findings, responses and corrective actions to audits, both external and internal.

20.1.2 Results from performance evaluation studies, both internal and external.

20.1.3 Summaries of non-conformities and corrective actions for routine analytical operations.

20.1.4 Completed internal audit evaluation

20.1.5 Results of technical reviews of personnel and analytical activities.

20.2 QA Reports to management shall be prepared and submitted annually prior to the managerial meeting.

Controlled Document

Example of a Performance Audit QC Report

Micro Methods Laboratory
Annual QC Audit Report
January 2001- 2002

Performance A	Type	System Tested	Reported Result	True Val	Corrective Action
1-12-01	Internal	Metals—Unacceptable DMR results on Hg and As			See Attached Corrective Action Report
1-16-01	Internal	Wetlab—Unacceptable results on Ammonia & Phosphorous			See Attached Corrective Action Report
6-29-01	Internal—results of WP Apr 2001	Metals—Molybdenum	256	396	Results were reported from ICP-1, due to maintenanc problems with ICP-2, Performed Maintenance on ICI ran WP test again on ICP-2 –acceptable results
		Metals—Thallium	82.6	403	See above
		Metals—Zinc	579	500	See above
		Metals—Potassium	20.8	17	Results reported from Flame AA, ICP needed maintenance, Performed Maintenance on ICP-2, ran ' test again on ICP-2 –acceptable results
		Metals—Sodium	39.2	47	See above

FLOOD PROTECTION

CAVENHAM FOREST INDUSTRIES LLC
Mobile, Alabama

File 86C5076

Made by RAS Date 5-12-86

FOR Flood Protection

Checked by DSM Date 4/26/86

Scope: Identify whether the facility is located within a 100 year floodplain. Determine the maximum wave height generated in Three Mile Creek. Determine a flood protection scheme, if required, to withstand washout from a 100-year flood.

Given:

Crown Zellerbachs entire Mobile facility is located within the 100 year floodplain as shown on the Federal Insurance Administration (FIA) Flood map, Community Panel Number 015057 0002 B. The property is zoned A2 and the 100 year flood elevation is 12 feet Mean Sea Level (MSL

Ref: RCRA EPA ID # ALD 057226907
270.14(b)(11)((c)(c))

Assumptions:

1. The average fetch distance is approximately 500 feet from due south of the site
2. The maximum fetch distance is approximately 1000 feet from the southeast and southwest quadrant.
3. Assume maximum wind velocity of 100 mph during a hurricane.
4. Assume mean high water in Three Mile Creek is +1' MSL.
5. Assume average ground surface elevation is +4' MSL.

FOR Flood Protection

Solution:

Estimate the maximum design elevation for slope protection.

Max Elev. = Mean high water + wind set-up + swash height

Note: There is a major obstruction across the creek & the southeast which will restrict the development of waves to the estimated height. The presence of the train embankment, and piers in the channel will disrupt normal wave generation.

Design wave heights can only be approximated for fetch distances less than 1 mile.

Wave height = 2.0 feet Ref: Design of Small Dams page 272.

Wave height = 2.0 feet for constant depth = 5'

= 2.5 feet for constant depth = 10'

Ref: Corp of Engineer Shore Manual see sheet 3

Wave height: Molitor formulas

$$H = 0.17\sqrt{VF} + 2.5 - \sqrt[4]{F}$$

V = wind velocity, mph
F = fetch (nmi) assume $F = 0.2$

$$H = 0.17\sqrt{100\,(0.2)} + 2.5 - \sqrt[4]{0.2} = 2.6 \text{ feet}$$

Ref: NAVFAC DM-

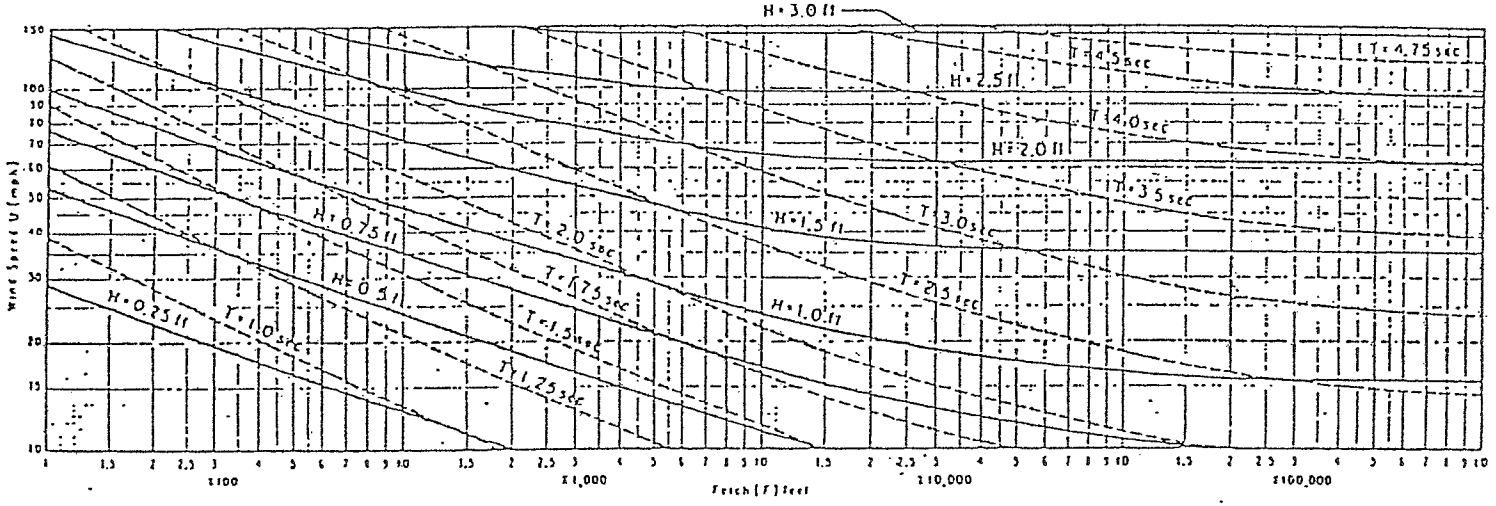

Figure 3-23. Forecasting Curves for Shallow-Water Waves. Constant Depth = 5 feet.

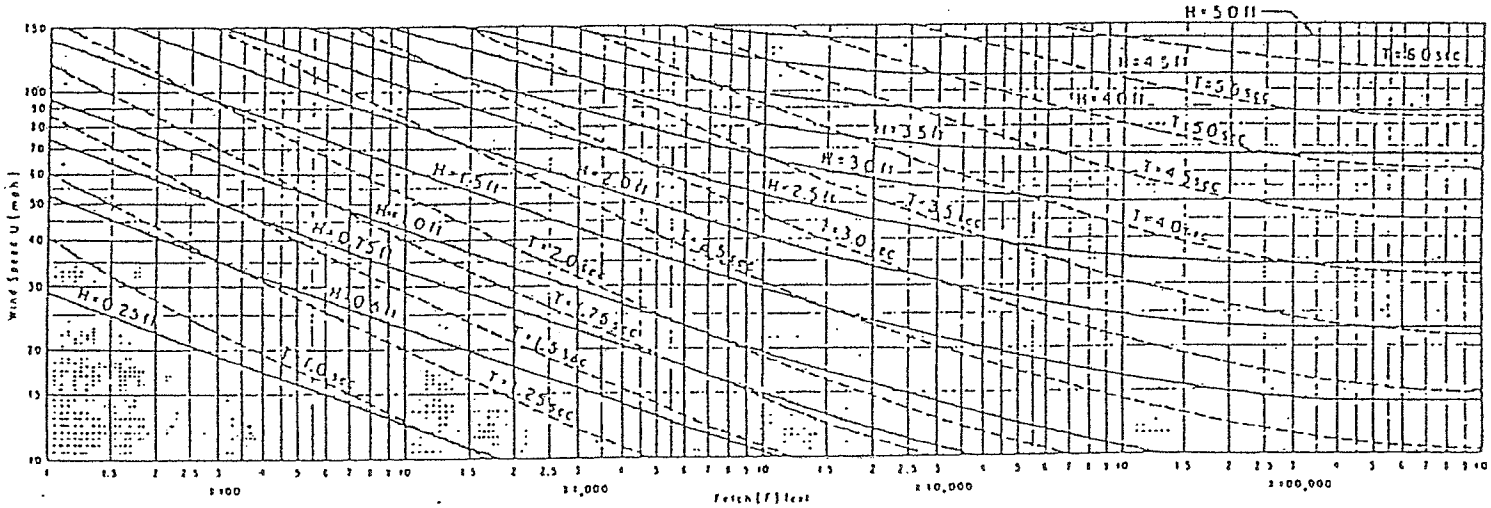

Figure 3-24. Forecasting Curves for Shallow-Water Waves. Constant Depth = 10 feet.

Avg wave height = $\frac{3.0 + 2.0 + 2.5 + 2.6}{4} \cong 2.5'$

Wind setup

$$S = 0.158 \times 10^{-3} \left(V^2 \frac{F}{D}\right) \cos\theta$$

V = wind velocity, mph

F = effective fetch = ≅ 0.2 1 nautical = 1.151 statute

D = water depth = 5' assumed

θ = 1

$$S = 0.00158 \left(100^2 \left(\frac{0.2}{5}\right)\right)(1) = 0.032 \text{ ft}$$

Swell Height

Swell height = $0.17 H^{\frac{5}{4}}$

H = 2.5'

Total height = 2.5 + 0.2 + 1.75(2.5) = 7.1'

The total wave height is above mean high water El +1'. The wave height elevation does not include tidal or storm surge.

Assume a MHW level +1' the Top of wave action is +1 + 7.1' = El +8.1'

Assuming the soil ground surface elevation is +4 a dike would have to be 8.1' - 4 = 4.1' feet above existing grade to protect from wave height only.

Note the flood level remains at El +12'

FOR Flood Protection

Wave protection can be incorporated into the proposed perimeter access road by increasing its height and protecting the slope. It is anticipated with the presence of wood fill and peat beneath the cell that significant total and differential settlements may occur along the access road. Since settlements are anticipated it is recommended that the rip-rap for slope protection be flexible in nature.

1.0 INTRODUCTION

This contingency plan is prepared for the Cavenham Forest Industries LLC (CFI) Mobile site located on the south end of Herbert Street in Mobile, Alabama. Figure E-1 shows the site location. Figure E-2 is a site plan that shows the layout of the site and the existing facilities. The site was formerly a wood treating plant which produced treated wood products (predominantly utility poles and piling) using the preservatives creosote and pentachlorophenol. During the active life of the facility, it used surface impoundments, drying beds, and drum storage facilities that have been closed as an on-site landfill. Hazardous waste managed at this site has been largely the ADEM Administrative Code Rule 335-14-2-.04(3) defined waste K001 specifically, wastewater treatment sludge from the on-site treated wood operation that collected in surface impoundments. Other defined wastes managed at this site include F032 and F034, when investigative derived waste (IDW) has been produced as part of the remedial and/or investigatory process. Table E-1 provides a listing of the constituents that are the basis for the waste code listings.

Presently, there is no K001 sludge being generated or stored by the Mobile facility. However, groundwater and effluent are being pumped and treated because it contains K001 listed constituents.

This contingency plan documents procedures to be implemented when an imminent danger to human health or the environment is posed by wastes contained in or released from the Mobile facility.

With the exception of activities pertaining to site remediation and groundwater corrective action, hazardous waste is not expected to be generated, stored, treated, or sent off-site. Groundwater treatment at the CFI Mobile site will result in the generation of spent activated carbon and organic-(oil-) phase liquid for off-site shipment, which is conservatively manifested as K001 waste. The only on-site activities will be facility inspections, groundwater pumping, groundwater treatment system operation, and monitoring. No hazardous or dangerous incidents resulting from these activities are expected; however, this plan is suitable for use in responding to emergency situations which might involve or threaten the operation of the closed Mobile facility.

2.0 CRITERIA FOR IMPLEMENTATION OF THE CONTINENGENCY PLAN

The purpose of this section is to provide the Emergency Coordinators (EC) with a set of decision-making criteria and in no way is intended to mandate or restrict the circumstance under which the contingency plan may be implemented.

The main on-site activity is the pumping and treatment of groundwater containing organic material from former creosote operations. Therefore, dangerous or life-threatening situations are not foreseen, although this plan addresses remotely possible emergencies.

Employees and contractors will immediately notify the on-site EC upon identifying any fire, explosion or release of hazardous waste or constituents which could threaten human health or the environment. The EC will then notify the Environmental Manager (EM). Upon notification, and based upon the information received, the EM and/or EC will determine if the contingency plan should be initiated. The EM shall delegate responsibilities to other employees, such as the lab manager for waste identification, and the Health & Safety Manager for selection of appropriate personal protection equipment (PPE) and other pertinent safety protocols.

The contingency plan will be put into effect if the possibility exists that one, or more, of the following situations exists during an incident:

- The incident threatens human health and the environment outside the facility boundaries.
- Additional outside assistance is necessary to bring the incident under control.
- Evacuation of the local area is necessary.
- The potential of an impending explosion is high.
- An incident that causes the release of toxic fumes.
- An incident that spreads and could possibly ignite materials at other locations.
- A fire/explosion that could possibly spread to off-site areas. Use of water or chemical suppressant on a fire that results in contaminated run-off.

2.1 FIRE AND/OR EXPLOSION

For purposes of this plan, a fire that could threaten human health or the environment is defined as combustion of waste such that it is not readily controllable by facility personnel using on-site equipment and/or available fire extinguishing material. Common fire extinguishing material that is stored on-site includes, but not limited to, fire extinguishers, water and dirt. **EMS does not require nor expect any untrained employee or contractor to attempt to suppress/extinguish a fire**.

If it is determined that the contingency plan should be activated and additional outside aide is needed to contain and/or suppress the fire/explosion, the emergency response agencies shall be notified immediately. The notifier should be ready to supply as much of the following information as possible:

- The nature and extent of the incident (fire and/or explosion and magnitude);
- The location of the incident;
- The nature and quantities of materials involved;
- The nature of any injuries sustained (number of injured and seriousness);

- The potential of subsequent explosions or spread of fire to other hazardous materials;
- The extent or possibility of released material to the air and immediate surrounding areas; and,
- Wind direction and relative speed.

The EC shall direct the emergency response efforts until more qualified emergency responders arrive on-scene. Should the EC not be present or able to perform said role the next most qualified personnel shall direct the response efforts. These efforts may include, as appropriate and necessary, the following activities:

- Ensure all on-site personnel are evacuated to a safe area;
- Establish necessary lines of communication;
- Provide all necessary PPE;
- Monitor the nature of the fire/explosion;
- Limit or restrict the traffic in the area;
- If safe and practical, remove waste containers or combustibles that could aggravate the situation;
- If safe and practical, collect and/or contain any released waste; and/or,
- Construct barrier walls to serve as firebreaks and as temporary containing measures, and control off-site discharge of wastes.

2.2 RELEASES OR SPILLS OF HAZARDOUS MATERIALS

For the purpose of this sections, a release or spill is defined as 55-gallons or more of material outside of its container or tank, not on sacrificial soils or not contained within other containment structures. For materials on sacrificial soils or inside a containment structure, a spill or release shall be considered to have occurred if the material poses a threat to other materials within the same containment unit.

If a release/spill occurs, the EC will immediately take the following actions, as appropriate and necessary:

- Notify the EM and provide the following information:
    - Exact location;
    - Material involved;
    - Quantity involved;
    - Topographic and environmental conditions;

- Circumstance that may hinder responses; and,
- Injuries, if any.

- Notification of the National Response Center and local authorities must occur immediately upon discovery of "Reportable Quantity" discharges;
- Turn off all ignition sources
- Turn off lift pumps;
- Locate the source of release/spill;
- If safe to do so, isolate the source of the release/spill to prevent/stop flow;
- If safe to do so, contain the material by constructing earthen berms, deploy sand bags and/or absorbent socks, and/or dig temporary containment pits downgradient of the spill, as necessary and practical; and,
- Deploy absorbent socks and sorbent material along the shoreline to prevent material from entering waters, as necessary and practical.

2.3 SEVERE WEATHER

The potential exists for flooding of the hazardous waste storage treatment and facilities. Three-mile creek abuts the southern edge of the property near its confluence with the Mobile River. The greatest threat to flooding occurs during tropical storms that frequent the northern gulf coast during hurricane season. Prior to a potential tropical storm impacting the site, operations of the groundwater extraction and water treatment unit is stopped and all portable hazardous waste containers are secured.

No personnel will be on-site during a tropical storm event. Once safe to do so site personnel will inspect the site to determine the extent, if any, of damages and/or releases. Should a release have occurred during the flood/storm all notifications will be made as appropriate and necessary.

3.0 EMERGENCY COORDINATORS IDENTIFICATION

During the post-closure care period, the site Environmental Supervisor will also be the site EC. The EC and/or EM are responsible for deciding when the contingency plan will be implemented.

During the post-closure care period CFI personnel or CFI contract personnel will normally be on-site performing routine inspections, operations, and maintenance activities. After hours, the EM and EC can be contacted at the telephone number posted outside the door of the facility office building and contained on the frontispiece of this plan. This list is updated, as necessary. All employees read the Contingency Plan at least annually and are thoroughly familiar with the plan and plan implementation.

The EC retains primary authority and responsibility for the plant, personnel, and physical properties. In this capacity, he has the authority to make all necessary expenditures in order to respond to emergency situations such as fires or releases of hazardous waste.

In the event of an emergency situation, the EC is notified first. If the EC cannot be notified, then the EM or a secondary coordinator will be notified. Attempts at notification will be made in order of appearance on the frontispiece (Contacts for Emergency Services) until a successful notification is made. A successful notification is deemed actual voice contact with an EC. For periods of time when no employees are on-site, a "corporate" phone number will be posted at the door of the office. See Exhibit 1.

4.0 EMERGENCY EQUIPMENT

All of the emergency response equipment, with the exception of off-site mobile equipment, is located in a locker in the southwestern corner room of the office building, in the laboratory, and in the building located at the water treatment system. A list of emergency equipment, which includes a description of the location where this equipment is stored, is found in Table E-2.

5.0 EVACUATION PLAN

Evacuation of the site will not normally be required since the only on-site activity will be the treatment of contaminated groundwater, and maintenance of the final Hazardous Waste Management Area cap and grounds. Should an incident occur, the major emphasis is placed on containing and controlling the hazard to prevent the hazard from increasing. However, in certain situations where an uncontrollable spill exists or there is an imminent danger of fire, evacuation may be advisable. The EM and/or EC is responsible for determining which situations require evacuation and the extent of the evacuation. Evacuation routes would be to exit the property to the north with rally points outside the property boundary. An alternative emergency evacuation route would be to the east of the property along the railway. From the railway evacuees could continue either northerly or southerly along the track to a designated meeting place. A diagram of the site's evacuation routes is included as Figure E-3.

6.0 CONTINGENCY PLAN COPY LOCATION

The Contingency Plan is located in the site office building and a copy is maintained at the corporate headquarters of Environmental Management Services, Inc. in Hattiesburg, MS. Environmental Management Services, Inc. provides personnel for daily operation and maintenance under contract to CFI. Other copies of the plan have been distributed to emergency response agencies and centers in the Mobile area. Table E-3 provides a plan distribution list. Exhibit E-2 provides documentation the plan was delivered to the facility on the distribution list.

7.0 CONTINGENCY PLAN AMENDMENT

Amendment of the Contingency Plan is the responsibility of CFI. Either CFI or their contract consultant will amend the plan in the event of changes in facility design, construction, operation, or maintenance. This person must also modify the plan in response to other circumstances that would materially increase the potential for fires, explosions, or releases of hazardous waste or hazardous waste constituents, or that change the response necessary in an emergency.

The plan is reviewed during each facility permit application revision. It will also be reviewed and modified accordingly should it fail in an emergency.

If changes are required during a Plan review, the changes will be incorporated into the Plan and a revised copy or amendment will be mailed to all entities contained in the mailing list shown on Table E-3.

8.0 EMERGENCY PROCEDURES

On discovery of an emergency situation, the EC will be immediately notified. If this person is not on-site at the time of the emergency, he or she will be contacted at home, the number is the first number listed in the Contacts for Emergency Services list found on the first page (frontispiece) of this plan. Phones are available in the site office building. Most employees working at this facility maintain cellular phones in their vehicles.

Because the plant site is relatively small, the EC may be able to contact plant personnel by voice. Otherwise, he may contact personnel using a regular or "cellular" telephone. Additionally, notification will normally be made to the other members on the contact list, informing them on the nature of the emergency and what the response will be. The EC, in turn, will organize and direct personnel to carry out the assigned tasks.

9.0 ARRANGEMENTS FOR EMERGENCY SERVICE

The EC and/or EM shall decide whether immediate state, local, or private assistance is required. The frontispiece outlines available suppliers, state and national agencies, and local emergency service groups with whom emergency service arrangements have been made, along with their phone numbers. The frontispiece also contains some emergency service numbers having no formal emergency service arrangements with the Mobile facility.

10.0 PROCEDURE FOR IDENTIFICATION OF HAZARDOUS WASTE

The EC will immediately identify the exact source of the release. The identity and characteristics of the released waste will be determined using the coordinator's knowledge of the site and its waste characteristics.

If for some reason the waste cannot be identified or if quantification is required, grab samples of the suspect material will be collected and sent to an outside laboratory. Samples will be analyzed for the chemical characteristics of K001, and/or F032 and F034 wastes listed in Table E-1. These analyses will employ appropriate test methods as found in the EPA's publication SW-846.

The amount and extent of the release will then be determined. Estimates of the amount of released waste will be based on tank volumes, visual inspections, or chemical analyses, as warranted. A qualitative description of the extent of the release will be made, including releases to the air and surface waters, as well as land, as soon as possible. This may be followed by a more quantitative approach, if warranted.

11.0 PROCEDURE FOR ASSESSMENT OF ENVIRONMENTAL/HUMAN HEALTH HAZARDS

The EC will assess the hazard based on knowledge of the release developed in the preceding section. Possible exposure paths (including air, water and groundwater) will be determined. If local agencies are required for assistance, then these agencies will be consulted before completing the initial assessment. Assessments will be updated when necessary to reflect changing conditions.

In the event an evacuation is called for by the EC, the following actions will be taken:

> All site personnel will be contacted and advised that an evacuation has been ordered. At this time the supervisor or personnel will be informed whether his crew, or part of his crew, is to remain on the plant site as part of the emergency response team. Primary and alternative evacuation routes are shown in Figure E-3.
>
> Personnel not authorized to remain will leave the plant site by the designated evacuation route unless the EC has indicated a need to evacuate via the alternative route. Plant personnel will advise all visitors and contractors to immediately leave the plant site by the designated or alternate evacuation route, and to meet at a designated rally point. The primary rally point will be outside the eastern side of the office building near the Herbert Street entrance. The alternate rally point will be at the railroad near the location of well UG-1, or to the south at the railroad trestle. Employees, visitors, and contractors should leave in groups whenever possible. All groups will remain together until the group reaches the rally point. No one may leave the rally point until everyone is accounted for.

All persons at the designated rally point will be accounted for by the highest-ranking supervisor, or if no supervisor is present, by the highest-ranking employee. A list will be compiled of the names of all persons meeting at the rally point. This list will be hand-delivered to the EC.

The list of persons at the rally point, the list of emergency response team members, and the list of persons leaving and entering the plant will be compiled by the EC in order to account for all persons on the plant site at the time the evacuation order was given.

Any attempts to find persons not accounted for will not involve endangering the lives of others by entering hazardous areas.

Entry into the evacuated area by unauthorized persons will be allowed only after the EC has declared the emergency over and given his authorization for re-entry into the plant.

12.0 NOTIFICATION OF STATE EMERGENCY SERVICES COORDINATOR

If the EM and/or EC determines that the facility has had a release, fire, or explosion that could threaten human health or the environment, then he must immediately notify the **Alabama Emergency Management Agency Coordinator** at **(251) 460-8000** during or after working hours. The EC report must include:

- Name and telephone number of the owner or operator
- Name and address of facility
- Time of incident and type of incident
- Identification and quantity of materials involved, to extent known
- The extent of injuries, if any
- Possible hazards to human health or environment
- Estimated quantity and disposition of recovered material that resulted from the incident

Within 15-days of the emergency incident, CFI will submit a written report to the Alabama Department of Environmental Management. The report will include completion of applicable portions of the form shown in Exhibit E-3.

A copy of the Contingency Plan has been sent to local emergency authorities. Refer to Exhibit E 2 for documentation of these mailings.

13.0 PROCESS SHUTDOWN AND MONITORING PROCEDURES

Monitoring duties will be completed by the site Environmental Technician. Monitoring duties will normally consist of checking existing or possible spill sources or sources of leakage. Where possible, the person will attempt to close leaking valves, etc. If the person determines that the hazard cannot be quickly remedied, he must immediately notify the EC , who in turn notifies the appropriate project management personnel. A list of these phone numbers is found in the frontispiece of this plan. No monitoring will be done that might endanger the life of plant personnel.

14.0 WASTE DISPOSAL AND CLEAN-UP PROCEDURES

The only hazardous waste generated, stored and treated results from groundwater corrective action associated with the closed units, and any spent activated carbon that is used in the water treatment process. Should a spill occur, CFI will make arrangements for the treatment, storage, or disposal of recovered waste, contaminated soils, surface water or any other contaminated material.

When spilled material is recovered, the EM will determine if the recovered material is hazardous. Unusable recovered material and contaminated soils and equipment will be disposed of in an environmentally sound manner. Soils that are non-hazardous will be returned to the area from which they were removed or used on-site as fill material.

An off-site contractor would be employed to remove and properly dispose of the waste.

No disposal or clean-up is expected to be necessary from the closed facilities.

15.0 EMERGENCY EQUIPMENT CLEANING AND REFITTING PROCEDURES

After an emergency event, all emergency equipment will be cleaned with steam and/or with soap and water to make it suitable for service. Decontaminated, or otherwise serviced or replaced equipment will be returned to original storage locations for future emergency uses. Any contaminated liquids that are generated will be routed to the water treatment system.

All equipment that cannot be decontaminated will be properly disposed of, along with residues from the decontamination process. Appropriate personnel protection equipment and safety measures will be employed to protect employees or contractors and the environment.

16.0 SPECIAL EMERGENCY PROCEDURES FOR THE SURFACE IMPOUNDMENTS

The surface impoundments have been capped as a part of closure. No emergency is anticipated from the closed Hazardous Waste Management Area.

17.0 PROCEDURES TO REPAIR THE CAP

The possibility of catastrophic failure of the cap is unlikely. Should a cap fail by slumping or erosion, the failing areas will be reinforced with locally obtained fill material or sandbags. The CFI management will be contacted and off-site contractors will be employed to correct the failure.

Carbon beds and piping associated with the water treatment system are inspected regularly for indications of corrosion or failure.

18.0 PROCEDURE FOR NOTIFYING THE ALABAMA DEPARTMENT OF ENVIRONMENTAL MANAGEMENT

The Alabama Department of Environmental Management will be notified within seven (7) days of detection of any un-permitted discharge from the facility. The notification will contain an explanation of the problem, the date and time materials were released, a discussion of actual or potential hazards (if applicable), and the remedial measures planned or accomplished. The form shown in Exhibit E-3 will be used.

19.0 EMERGENCY MEDICAL PROCEDURES

Medical procedures for certain injuries that could occur during routine monitoring and maintenance are detailed below. Other injuries such as burns, cuts, and fractures that could occur during an emergency should be treated by a trained medical professional.

Procedures for treating injuries specific to the site's waste, as specified in the facility's material safety data sheets (MSDS), are provided below. Copies of MSDS sheets for creosote and pentachlorophenol are provided in Exhibit E-4.

Skin Contact - remove contaminated clothing and shoes. Wash skin thoroughly with soap and water or waterless hand cleaner for at least 15 minutes. Wash contaminated clothing before reuse. Avoid solvents. For relief of irritation, creams such as Topicort, Cortaid and Lanacort have been useful. If irritation persists, seek medical aid.

Eye Contact - Flush eyes immediately with large amounts of water for at least 15 minutes. Call a physician.

Inhalation - Remove from exposure. If breathing has stopped or is difficult administer artificial respiration or oxygen as appropriate and necessary and **seek IMMEDIATE medical aid**.

Ingestion - **Get IMMEDIATE medical attention**. If a medical professional directs the on-site responder the following actions may be helpful:

- If victim is conscious and alert, give 1- to 2-glasses of water or milk.
- Induce vomiting using ipecac syrup as directed on the label.
- For creosote ingestion: after vomiting, the victim may be given a slurry of 100-g of activated charcoal in 8-oz. of water (if directed to do so by trained medical personnel).

20.0 PLANT LOCATION AND SITE DESCRIPTION

The CFI Mobile facility is located at the south end of Herbert Street in northern Mobile, Alabama. The attached Figure E-1 shows the location of the site. Figure E-2 is a detailed site plan.

Prior to closure this facility manufactured utility poles and foundation piling by pressure impregnation with creosote or pentachlorophenol wood preservative.

The CFI Mobile facility has completed a closure that meets applicable RCRA regulations. The existing site now consists of the following:

- Closed Hazardous Waste Management Area and former Process Area;
- Office Building; and,
- Water Treatment System and Building.

20.1 WATER TREATMENT SYSTEM DESCRIPTION

During the post-closure care period, the Water Treatment System will be employed to treat groundwater and effluent from the Gradient Control System. The Gradient Control System consists of french drain type recovery piping located within the closed Hazardous Waste Management Area.

The Mobile facility's water treatment system is in continuous operation, typically running 24-hours a day, seven days a week. The system employs gravity flow through all separators and biological treatment units until the process reaches the activated carbon tanks where pumping is required. Since creosote has a higher specific gravity than water, the separation of the oil phase from the water phase is the reverse of typical oil separators associated with many petroleum products which float.

This system is designed to treat groundwater from post-closure operations at the Mobile facility by removing any creosote constituents first physically, then biologically. The quality of water after treatment is high enough to allow either discharge to surface waters or injection. All tanks in the entire system are above ground. The entire treatment system is contained within a concrete secondary containment system. Storage tanks have earthen secondary containment and all are considered part of the NPDES water treatment system.

Treatment begins by removing groundwater from the recovery well system via dedicated pumps located at each well. The groundwater or well effluent is pumped to either of Receiver Trough 1 or Receiver Trough 2, depending upon the organic content of the effluent water. Low organic content well effluent typically goes to one trough while high organic content water is directed to the other. Each trough aerates the water to enhance oil (organic-phase) separation. The clean or water phase of the high organic content water trough flows from the trough to Oil/Water Separator No. 3 while any recovered organic material is sent to Oil/Water Separator No. 2.

The low organic content well effluent/water from the receiver trough flows to Oil/Water Separator No. 1. The oil phase that settles from all three Oil/Water separators (Nos. 1, 2, and 3) stays in the units until there is enough volume to drain the oily phase into an oil storage tank. All of the water phase from Oil/Water Separator No. 2 then flows into Oil /Water Separator No. 3. The water or clean phase from both sections of Oil /Water Separators No. 1 and No. 3 flows into the Aeration Tank (Conditioning Tank) where it aerates and equalizes the flow of the water. From there, the water flows into one of the biological treatment areas of the system.

There are three separate fixed-film units. The first two units are connected to the Aeration Tank by a manifold and operate in parallel. Each unit has four fixed-film sections or cells, connected in series. The first cell (section) in each unit is the primary biological treatment section, the three following sections (cells) are for secondary biological treatment. The flow from these two fixed-film units converges and flow into the third fixed-film unit for final biological treatment. The fixed-film cells employ micro-organisms to break down the trace amounts of different organic chemical constituents of creosote into simpler compounds.

The flow from these units collects in a common tank called the Bio-Mass Accumulator which flows into one of four 18,000-gallon bio-treated water storage tanks. These tanks provide equalization and storage before the water is pumped into tanks containing activated carbon. When enough water has accumulated, it is pumped through two activated carbon tanks in series (with 2 additional units in parallel on reserve), prior to storage in the final holding tank. After treatment by activated carbon, the water is discharged through permitted NPDES Outfall 001 to 3-Mile Creek, or pumped to the injection system.

20.2 COMMUNICATION SYSTEMS

Internal - Phones are located in the office building and employees typically carry a cellular phone.

External - The telephone system serves as the site's external communications system. Most on-site employees carry cellular telephones which safeguard against interruption of telephone service in the event of power failure. It can also be used whenever work must be performed outside the office building, away from the regular phone line.

20.3 SAFETY EQUIPMENT

Safety equipment is stored in the wastewater treatment building and in the office building in a storage locker. (See Table E-2).

Material Name
CREOSOTE SOLUTION (PRESSURE APPLICATIONS)

Synonyms
AWPA P2; EPA REG. # 61468-3

Chemical Family
Hydrocarbons, coal-tar

Product Description
This material meets AWPA specification for P2 creosote and is an EPA registered pesticide. Extensive animal testing has been conducted by the Creosote Council on creosote and the results are reported in Section 11.

Product Use
Creosote (P2) is registered only for pressure treatment of wood. Wood treaters must not knowingly pressure treat wood commodities that are not encompassed in the American Wood Protection Association (AWPA) Use Category System, as set forth in the most current edition of the AWPA Book of Standards. Refer to product label for more details.

Restrictions on Use
Restricted Use Pesticide; for sale to and use only by certified applicators or persons under their direct supervision and only for those uses covered by the certified applicators' certification.

Details of the supplier of the safety data sheet

KOPPERS INC.
436 Seventh Avenue
Pittsburgh, PA 15219-1800
Mfg Contact: 412-227-2001 (SDS Requests: 866-852-5239)

CHEMTREC: 800-424-9300 (Outside USA: +1 703-527-3887)
Emergencies: (Medical in USA): 877-737-9047
Emergencies: (Medical Outside of USA): 651-632-9269

Section 2 - HAZARDS IDENTIFICATION

Classification in accordance with paragraph (d) of 29 CFR 1910.1200.
Serious Eye Damage/Eye Irritation - Category 2B
Carcinogenicity - Category 1B
Specific target organ toxicity - Single exposure - Category 3 (Respiratory system)
Hazardous to the Aquatic Environment - Acute - Category 1
Hazardous to the Aquatic Environment - Chronic - Category 2

GHS Label Elements

Symbol(s)

Signal Word
Danger

Hazard Statement(s)

Causes eye irritation.
May cause cancer.
May cause respiratory irritation.
Very toxic to aquatic life.
Toxic to aquatic life with long lasting effects.

Precautionary Statement(s)

Prevention

Avoid breathing dust/fume/gas/mist/vapors/spray.
Wash thoroughly after handling.
Wear protective gloves/protective clothing/eye protection/face protection.
Obtain special instructions before use.
Do not handle until all safety precautions have been read and understood.
Use only outdoors or in a well-ventilated area.
Avoid release to the environment.

Response

IF exposed or concerned: Get medical advice/attention.
IF INHALED: Remove person to fresh air and keep comfortable for breathing.
Call a POISON CENTER or doctor/physician if you feel unwell.
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
If eye irritation persists: Get medical advice/attention.
Collect spillage.

Storage

Store in a well-ventilated place.
Keep container tightly closed.
Store locked up.

Disposal

Dispose of contents/container in accordance with local/regional/national/international regulations.

Other Hazards

Heated material may cause thermal burns.

Section 3 - COMPOSITION / INFORMATION ON INGREDIENTS

CAS	Component Name	Percent
8001-58-9	Creosote	100
-	The above listed complex substance contains the following constituents	-
85-01-8	Phenanthrene	11.2-18.2
206-44-0	Fluoranthene	7.2-10.8
83-32-9	Acenaphthene	5.8-8.6
91-57-6	2-Methylnaphthalene	4.4-8.5
91-20-3	Naphthalene	0.9-7.5

129-00-0	Pyrene	4.5-7.0
86-73-7	Fluorene	3.8-6.3
120-12-7	Anthracene	2.2-5.0
132-64-9	Dibenzofuran	3.0-4.3
90-12-0	1-Methylnaphthalene	2.1-3.9
95-13-6	Indene	0.0-3.7
56-55-3	Benz[a]anthracene	1.8-3.3
218-01-9	Chrysene	1.9-3.1
86-74-8	9H-Carbazole	1.2-2.9
92-52-4	Biphenyl	1.2-1.9
243-17-4	Benzo[b]fluorene	0.7-1.6
91-22-5	Quinoline	0.7-1.5
238-84-6	Benzo(a)fluorene	1.1-1.4
205-99-2	Benzo(b)fluoranthene	0.7-1.3
205-82-3	Benzo(j)fluoranthene	0.7-1.3
208-96-8	Acenaphthylene	0.7-1.0
217-59-4	Triphenylene	0.2-0.9
192-97-2	Benzo(e)pyrene	0.3-0.6
50-32-8	Benzo[a]pyrene	0.1-0.5
496-11-7	Indan	0.0-0.4
207-08-9	Benzo(k)fluoranthene	0.2-0.4
119-65-3	Isoquinoline	0.0-0.3

Component Related Regulatory Information

This product may be regulated, have exposure limits or other information identified as the following: Creosotes, polynuclear aromatic hydrocarbons, Aromatic hydrocarbons, polycyclic (130489-29-2).

Section 4 - FIRST AID MEASURES

Inhalation

If adverse effects occur, remove to uncontaminated area. Give artificial respiration if not breathing. If breathing is difficult, oxygen should be administered by qualified personnel. Move person to fresh air. If person is not breathing,

call 911 or an ambulance, then give artificial respiration, preferably by mouth-to-mouth, if possible. Call a poison control center or doctor for further treatment advice.

Skin
Take off contaminated clothing. Rinse skin immediately with plenty of water for 15-20 minutes. Call a poison control center or doctor for treatment advice. Wash all affected skin areas with warm soapy water. Skin contact causes photosensitization which can last for 36-72 hours after exposure. Keep out of direct sunlight for the next two to three days to avoid sunburn to the photosensitized skin areas. Use a broad spectrum blockout cream to protect against UV alpha ray exposure. Get medical attention, if needed.

Eyes
Hold eye open and rinse slowly and gently with water for 15-20 minutes. Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye. Call a poison control center or doctor for treatment advice.

Ingestion
Call a poison control center or doctor immediately for treatment advice. Do not induce vomiting unless told to do so by the poison control center or doctor. Do not give anything by mouth to unconscious or convulsive person. If vomiting occurs, keep head lower than hips to help prevent aspiration.

Most Important Symptoms/Effects
Acute
respiratory tract irritation, mild skin irritation, eye irritation, thermal burns from heated material

Delayed
skin cancer

Indication of any immediate medical attention and special treatment needed
Probable mucosal damage may contraindicate the use of gastric lavage. Vomiting may cause aspiration pneumonia.

Section 5 - FIRE FIGHTING MEASURES

Extinguishing Media
Suitable Extinguishing Media
regular dry chemical, carbon dioxide, water spray, regular foam

Unsuitable Extinguishing Media
high-pressure water streams.

Hazardous Combustion Products
oxides of carbon, oxides of nitrogen, polynuclear aromatic hydrocarbons

Advice for firefighters
Contact with heat may generate toxic and/or flammable gases. Containers may rupture or explode if exposed to heat.

Fire Fighting Measures
Move container from fire area if it can be done without risk. Cool containers with water spray until well after the fire is out. Do not scatter spilled material with high-pressure water streams. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tanks due to fire. Avoid inhalation of material or combustion by-products. Stay upwind and keep out of low areas. Use extinguishing agents appropriate for surrounding fire. Water may be used to blanket fire. Flood with fine water spray. Directly spraying water or foam onto hot burning product may cause frothing. For fires in cargo or storage area: Cool containers with water from unmanned hose holder or monitor nozzles until well after fire is out. If this is impossible then take the following precautions: Keep unnecessary people away, isolate hazard area and deny entry. Dike for later disposal.

Special Protective Equipment and Precautions for Firefighters
Wear full protective firefighting gear including self-contained breathing apparatus (SCBA) for protection against possible exposure.

Section 6 - ACCIDENTAL RELEASE MEASURES

Personal Precautions, Protective Equipment and Emergency Procedures

Avoid inhalation or contact. Provide adequate ventilation. Wear personal protective clothing and equipment, see Section 8. Avoid release to the environment. Collect spillage.

Methods and Materials for Containment and Cleaning Up

Keep out of water supplies and sewers. This product is toxic to aquatic organisms. Do not discharge effluent containing this product into lakes, streams, ponds, estuaries, oceans, or other waters unless in accordance with the requirements of a National Pollution Discharge Elimination System (NPDES) permit and the permitting authority has been notified in writing prior to discharge. Do not discharge effluent containing this product to sewer systems without previously notifying the local sewage treatment plant authority. For guidance, contact your State Water Board or Regional Office of the EPA. Avoid heat, flames, sparks and other sources of ignition. Do not touch or walk through spilled material. Stop leak if possible without personal risk. Absorb (with sand, earth, etc.) discharged material and dispose of in accordance with applicable Federal, State and local regulations. Contaminated materials must be handled and managed as RCRA Hazardous Waste and treated before disposal in an approved landfill. This waste is identified by the EPA as a U051 hazardous waste and must meet the treatment standards specified in 40 CFR 268 Subpart D. A RCRA hazardous waste storage permit is required for storage of wastes beyond 90 days. In Canada, report releases to provincial authorities, municipal authorities, or both, as required. If this product is spilled or leaked into the environment, the CERCLA (40 CFR 302.4) reportable quantity is 0.1 gallons (1 pound), and requires National Response Center notification.

Section 7 - HANDLING AND STORAGE

Precautions for Safe Handling

Avoid breathing vapor or mist. Avoid contact with eyes, skin and clothing. Avoid ingestion. When using do not eat or drink. Wear protective gloves/clothing and eye/face protection. Wash exposed areas thoroughly with soap and water, or a waterless hand cleaner, after skin contact and before eating, drinking, using tobacco products, or restrooms. Use protective skin cream on exposed skin before and during work shift. To reduce sun sensitivity a sun-blocking lotion can also be applied prior to application of a protective cream. Remove and launder contaminated clothing separately from other laundry before reuse. After working with the product use warm soapy water and a wash cloth to thoroughly wash all areas of skin that have been contacted with product. After washing, apply a broad spectrum UV blockout cream on exposed skin areas before going into sunlight. Keep out of strong sunlight for two to three days after being affected by the product. Obtain special instructions before use. Do not handle until all safety precautions have been read and understood. Use only outdoors or in a well-ventilated area.

Conditions for Safe Storage, Including any Incompatibilities

Store in a well-ventilated place.
Keep container tightly closed.
Store locked up.
Store and handle in accordance with all current regulations and standards. Notify State Emergency Response Commission for storage or use at amounts greater than or equal to the TPQ (U.S. EPA SARA Section 302). SARA Section 303 requires facilities storing a material with a TPQ to participate in local emergency response planning (U.S. EPA 40 CFR 355 Part B). Label all containers. Avoid heat, flames, sparks and other sources of ignition. Store in a cool, dry place. Protect from physical damage. Keep separated from incompatible substances.

Incompatible Materials

oxidizing materials

Section 8 - EXPOSURE CONTROLS / PERSONAL PROTECTION

Creosote is a complex mixture of variable composition, and while no odor threshold for creosote has been established, work done at the University of California has measured the odor thresholds. for one of the more volatile components in creosote and determined that the involved odor threshold is in the part per billion range, and well below applicable exposure limits. On the basis of these data the perception of creosote odor in and of itself should not be taken as an indication of exposure in excess of accepted exposure limits.

Component Exposure Limits

Creosote	**8001-58-9**
ACGIH:	0.2 mg/m3 TWA as benzene-soluble aerosol (related to Pitch, coal tar, high-temperature)
OSHA (US):	0.2 mg/m3 TWA (benzene soluble fraction) (related to Pitch, coal tar, high-temperature)
Naphthalene	**91-20-3**
ACGIH:	10 ppm TWA
	Skin - potential significant contribution to overall exposure by the cutaneous route
OSHA (US):	10 ppm TWA ; 50 mg/m3 TWA
Biphenyl	**92-52-4**
ACGIH:	0.2 ppm TWA
OSHA (US):	0.2 ppm TWA ; 1 mg/m3 TWA

ACGIH - Threshold Limit Values - Biological Exposure Indices (BEI)

Creosote (8001-58-9)

Medium: urine Time: end of shift at end of workweek Parameter: 1-Hydroxypyrene with hydrolysis (nonquantitative) (related to Pitch, coal tar, high-temperature)

Naphthalene (91-20-3)

Time: end of shift Parameter: 1-Naphthol with hydrolysis plus 2-Naphthol with hydrolysis (nonquantitative, nonspecific)

Engineering Controls

Ensure adequate ventilation. Ensure compliance with applicable exposure limits. Refer to product label for more details.

Individual Protection Measures, such as Personal Protective Equipment

Eye/face protection

Wear splash resistant safety goggles with a faceshield. Provide an emergency eye wash fountain and quick drench shower in the immediate work area. Refer to product label for more details.

Skin Protection

Wear washable or disposable coveralls or long-sleeved shirt and long pants. Wear socks plus industrial grade safety boots with chemical resistant soles. Individuals who enter pressure treatment cylinders and other related equipment that is contaminated with the wood treating formulation must wear protective clothing (including overalls, jackets, gloves and boots) impervious to the wood treatment formulations and a respirator. Protective clothing must be changed when it shows signs of contamination. Remove and launder contaminated clothing separately from other laundry before reuse. Refer to product label for more details.

Respiratory Protection

If the applicable TLVs and/or PELs are exceeded, use NIOSH-approved multipurpose air-purifying cartridge respirators, for organic vapors and P-100 particulate. Use a positive-pressure, air-supplied respirator if there is any potential for uncontrolled release, exposure levels are not known, or any other circumstance where air-purifying respirators may not provide adequate protection. Individuals who manually open cylinder doors must wear gloves and a NIOSH-approved multipurpose air-purifying cartridge respirators, for organic vapors and P-100 particulate. Refer to product label for more details.

Glove Recommendations
Individuals must wear gloves impervious to the wood treatment formulations in all situations where dermal contact with creosote is expected.

Protective Materials
Examples of impervious materials for protective clothing (e.g. overalls, jackets, gloves and boots) required during application and handling of creosote are polyvinyl acetate (PVA), polyvinyl chloride (PVC), Neoprene and NBR (Buna-N).

Section 9 - PHYSICAL AND CHEMICAL PROPERTIES

Appearance	brown to black semi-liquid	**Physical State**	liquid
Odor	tar odor	**Color**	brown to black
Odor Threshold	Not available	**pH**	Not available
Melting Point	Not available	**Boiling Point**	287 - 863 °F
Boiling Point Range	Not available	**Freezing point**	Not available
Evaporation Rate	Not available	**Flammability (solid, gas)**	Not applicable
Autoignition Temperature	Not available	**Flash Point**	221 - 300 °F
Lower Explosive Limit	Not available	**Decomposition temperature**	Not available
Upper Explosive Limit	Not available	**Vapor Pressure**	0.01 - 0.306 mmHg
Vapor Density (air=1)	Not available	**Specific Gravity (water=1)**	1.1 at 60 °F
Water Solubility	(Insoluble)	**Partition coefficient: n-octanol/water**	Not available
Viscosity	Not available	**Kinematic viscosity**	Not available
Solubility (Other)	Not available	**Density**	Not available
Physical Form	semi-liquid at ambient temperature	**Molecular Weight**	Not available
OSHA Flammability Category	Not applicable*		

Other Information
*If not heated to within 30 degrees F of its Flash point

Section 10 - STABILITY AND REACTIVITY

Reactivity
No reactivity hazard is expected.

Chemical Stability
Stable at normal temperatures and pressure.

Possibility of Hazardous Reactions
Will not polymerize.

Conditions to Avoid
Avoid heat, flames, sparks and other sources of ignition. Containers may rupture or explode if exposed to heat. Keep out of water supplies and sewers.

Incompatible Materials
oxidizing materials

Hazardous decomposition products
oxides of carbon, oxides of nitrogen, polynuclear aromatic hydrocarbons

Section 11 - TOXICOLOGICAL INFORMATION

Information on Likely Routes of Exposure

Inhalation
irritation

Skin Contact
mild irritation, thermal burns from heated material, skin cancer

Eye Contact
irritation, thermal burns from heated material

Ingestion
gastrointestinal irritation, bloating

Acute and Chronic Toxicity

Component Analysis - LD50/LC50
The components of this material have been reviewed in various sources and the following selected endpoints are published:

Creosote (8001-58-9)
Dermal LD50 Rabbit >2000 mg/kg

Product Toxicity Data

Acute Toxicity Estimate

Dermal	>2000 mg/kg
Inhalation - Vapor	>5.3 mg/L (4 hr.)
Oral	2197 mg/kg

Immediate Effects
respiratory tract irritation, mild skin irritation, eye irritation, thermal burns from heated material

Delayed Effects
skin cancer

Irritation/Corrosivity Data
0.5 ml/4 hour(s) skin-rabbit mild (Draize Score-1.5/8.0); 0.1 ml eyes-rabbit mild (Draize Score-7.0/110.0), Rabbit Eye Irritation: No corneal changes; conjunctival changes all reversed by 7 days post treatment. Max irritation score = 7.0/110, Rabbit Dermal Irritation: Slight-to-well-defined erythema and very slight-to slight edema cleared by day 7, PSI = 1.5/8.0

Respiratory Sensitization
No data available.

Dermal Sensitization
Negative dermal sensitization in guinea pigs.

Component Carcinogenicity

Creosote	**8001-58-9**
ACGIH:	A1 - Confirmed Human Carcinogen (related to Pitch, coal tar, high-temperature)
IARC:	Monograph 100F [2012] ; Supplement 7 [1987] ; Monograph 35 [1985] (related to Pitch, coal tar, high-temperature) (Group 1 (carcinogenic to humans))
NTP:	Known Human Carcinogen (related to Pitch, coal tar, high-temperature)
NIOSH:	potential occupational carcinogen

In a 6 month mouse skin cancer initiation-promotion study, undiluted creosote or a 1% or 50% P1/P13 creosote suspension was applied daily for two weeks followed by six months of twice-weekly applications. Creosote was tested as a tumor initiator with TPA as a promotor, as a promoter with DMBA as an initiator, and as both an initiator and a promoter. Repeated applications of creosote produced skin irritation and acted as an initiator, a promoter and a complete carcinogen. Due to compositional similarities between P1/P13 and P2 creosotes and the documented consistency of results in mammalian toxicity testing of these creosotes, results of the mouse skin cancer study with P1/P13 creosote can be applied to P2 creosote for purposes of hazard assessment.

Germ Cell Mutagenicity
P2 was dosed at 866, 432 and 199 mg/kg/day in a rat dominant lethal bioassay. Animals in all dose groups showed pharmacotoxic signs following dosing and lost weight during the dosing period which was not recovered during the 10 weeks of mating following dosing. P2 creosote produced evidence of germ cell mutation (increase in dead implantation sites) at the high dose, a systemically toxic dose. The number of live implants was not significantly reduced and no dominant lethal effects were seen at weeks 8 or 9. P2 creosote is considered by the study director as negative for the induction of germinal chromosomal mutations in epididymal sperm , spermatids, and spermatocytes but positive in chromosome mutations in spermatogonial stem cells. Any effect in sperm stem cells was not manifest in mature sperm. In reviewing this study, the US EPA concluded that “the number of live implant/female was not significantly reduced. In addition, no dominant lethal effects were seen at weeks 8 or 9, which would have included spermatogonial stem cells. Therefore, creosote P2 is considered to be negative for dominant lethal effects in rats”.

Tumorigenic Data
No data available

Reproductive Toxicity
Due to compositional similarities between P1/P13 and P2 creosotes and the documented consistency of results in mammalian toxicity testing of these creosotes, results of the reproductive toxicity testing in rats with P1/P13 creosote can be applied to P2 creosote for purposes of hazard assessment. Pregnant rats treated with P2 creosote orally on days 6 through 15 of their pregnancy at 225, 75 and 25 mg/kg creosote showed signs of maternal toxicity were seen at all dose levels. Developmental toxicity was manifest at the maternally toxic dose (225 mg/kg) as an increased incidence post-implantation loss and litter resorptions and decreased body weight for male fetuses. There were no structural defects at any dose level as a result of creosote administration. Adverse effects were not seen in the absence of maternal systemic toxicity. P2 creosote, therefore, is not considered a developmental toxicant.

Specific Target Organ Toxicity - Single Exposure
respiratory system

Specific Target Organ Toxicity - Repeated Exposure
No data available.

Aspiration hazard

No data available.

Medical Conditions Aggravated by Exposure
respiratory disorders, skin disorders

Additional Data
This product is coal tar creosote. Volume 35 of the IARC monograph states that there is limited evidence that coal tar derived creosotes are carcinogenic in humans and sufficient evidence for the carcinogenicity of creosote in experimental animals (Group 2A). IARC's evaluation of the effects of coal tar creosote in humans is based on older occupational studies in the wood-preserving and construction industries. When applied to the skin of mice in experimental studies, creosote produced skin tumors and in one study produced lung tumors. Today, with the use of engineering controls and personal protective equipment, occupational exposure to creosote components is expected to be below permissible exposure limits (measured as CTPVs). Recently, the largest health effects study to date of workers employed in creosote wood treating plants (2,179 employees at eleven plants from 1979-2001) conducted by Dr. Otto Wong, found no evidence supporting an increased risk of cancer death as a result of exposure to creosote. The NOAEL for rats in a 13-week subchronic inhalation study was 4.7 mg/m3. The NOAEL for female rats in a 90-day subchronic dermal study was greater than 400 mg/mg, and the NOAEL for male rats was 40 mg/kg due to reduced food consumption in the high-dose male group. All other parameters for toxicity including ophthalmoscopic examination appeared to be completely unaffected by dermal creosote exposure. Based on Buehler dermal sensitization testing, creosote is not considered to be a dermal sensitizing agent. Prolonged or frequently repeated skin contact may cause allergic reactions in some individuals. Prolonged and repeated skin exposure over many years in the absence of recommended hygiene practices may lead to changes in skin pigmentation, benign skin growth, and in some cases, result in skin cancer. Inhalation – 90 day repeated exposure - Rats were exposed in whole body inhalation chambers to P2 creosote for 6 hours/day 5days/week for 13 weeks to 102, 48 and 4.7 mg/m3. Exposure (vapor and particulate) produced sporadic body weight loss or weight gain suppression in all exposure groups and staining of the animals' respiratory tract and lungs immediately after the 90-day exposure period. Creosote deposition in the nose and upper respiratory tract produced acute and chronic inflammation which decreased along the tract toward the lungs. These changes diminished in severity during the post-exposure recovery period. The lung changes were limited to pigment deposition in the mid-and high exposure groups. There were no treatment–related lung inflammatory or proliferative changes or lesions of any type. Liver weight changes were unaccompanied by histopathololgic changes. Thyroid changes (follicular cell hypertrophy) were noted in female creosote-exposed animals. This condition was not seen as a result of creosote treatment in males. No changes indicative of heart damage were observed in any animal following the recovery period. At the end of the exposure period and at the end of the recovery period animals were evaluated by a veterinary ophthalmologist for signs of eye damage due to airborne creosote. No test material related eye changes were recorded. The NOAEL level in this study was 4.7 mg/m3. Dermal – No systemic effects following single high-level exposure. In addition to containing information about the product as a whole, this data sheet also contains information about individual components of the product. Information of this nature may not have been derived from studies or data relating to this product and/or may have been derived from studies or data that did not involve human exposure and involved animal exposure only. A neoplastic effect was reported in mice with subcutaneous injection of 46 mg/kg of diphenyl. Some polycyclic aromatic hydrocarbons (PAHs), found in coal tar complex substances, have been reported to cause lung and skin cancer in humans under conditions of poor personal hygiene, prolonged/repeated contact, and exposure to sunlight. The National Toxicology Program (NTP) and IARC have independently classified various PAH compounds present in coal tar substances as reasonably anticipated to be human carcinogens (NTP), probably carcinogenic to humans (IARC Group 2A), possibly carcinogenic to humans (IARC Group 2B), and not classifiable as to carcinogenicity to humans (IARC Group 3). The cancers reported in the studies upon which IARC based its conclusions involved lung, skin, liver, stomach, kidney and blood cancers in animals. Based on the results of animal experiments PAHs may cause injury to the liver, kidneys, lungs, blood and lymph systems. Some PAH's have also been associated with impaired fertility, heritable genetic damage and birth defects in mice.

Section 12 - ECOLOGICAL INFORMATION

Ecotoxicity
Very toxic to aquatic life. Toxic to aquatic life with long lasting effects.

Component Analysis - Aquatic Toxicity

Creosote	**8001-58-9**
Fish:	LC50 96 h Brachydanio rerio 2.6 - 6.6 mg/L [static]; LC50 96 h Oncorhynchus mykiss 0.57 mg/L [static]
Invertebrate:	EC50 48 h Daphnia magna 1.04 mg/L IUCLID ; EC50 48 h Daphnia magna 0.065 - 0.082 mg/L [Static] EPA

Persistence and Degradability
No information available for the product.

Bioaccumulative Potential
This material is believed not to bioaccumulate.

Mobility
Insoluble in water.

Other Toxicity
No data available.

Section 13 - DISPOSAL CONSIDERATIONS

Disposal Methods
Dispose in accordance with all applicable regulations. Pesticide wastes are toxic. Improper disposal of excess pesticide or rinsate is a violation of Federal Law. If these wastes cannot be disposed of by use according to label instructions, contact your State Pesticide or Environmental Control Agency, or the Hazardous Waste representative at the nearest EPA Regional Office for guidance. Based on the results of the Toxicity Characteristic Leaching Procedure (TCLP), the following US EPA Waste Code may apply to used product and/or materials contaminated with used product: Cresols – D026 (toxicity >/= 200 ppm). The US EPA Waste Code U051 applies to disposal of unused product and wastes resulting from spills of the unused material.

Component Waste Numbers
The U.S. EPA has not published waste numbers for this product's components.

Section 14 - TRANSPORT INFORMATION

US DOT Information:
Shipping Name: ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID, N.O.S. , (Contains: Creosote) RQ
Hazard Class: 9
UN/NA #: UN3082
Packing Group: III
Required Label(s): 9
Further information: 'Environmentally hazardous substances, liquid, n.o.s.' applies for all container sizes. This material contains reportable quantity (RQ) Hazardous Substances.

IATA Information:
Shipping Name: ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID, N.O.S. , (Contains: Creosote) RQ
Hazard Class: 9
UN#: UN3082
Packing Group: III
Required Label(s): 9 - Miscellaneous
Further information: Passenger or cargo aircraft LTD QTY is 30 kg G (Pkg. instructions Y964), passenger or cargo aircraft 450 L (Pkg. instructions 964), S.P. A97 & A158, ERG 9L.

TDG Information:
Shipping Name: ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID, N.O.S. , (Contains: Creosote) RQ
Hazard Class: 9
UN#: UN3082
Packing Group: III
Required Label(s): Class 9 - UN3082

International Bulk Chemical Code
This material does not contain any chemicals required by the IBC Code to be identified as dangerous chemicals in bulk.

Further information
STCC Code: 2814125; HAZ STCC Code: 4963330; US DOT Reportable Quantities: COAL TAR CREOSOTE (8001-58-9) 1 lbs RQ; 0.454 kg RQ

Section 15 - REGULATORY INFORMATION

U.S. Federal Regulations
This material contains one or more of the following chemicals required to be identified under SARA Section 302 (40 CFR 355 Appendix A), SARA Section 313 (40 CFR 372.65), CERCLA (40 CFR 302.4), TSCA 12(b), and/or require an OSHA process safety plan.

Creosote	**8001-58-9**
SARA 313:	0.1 % de minimis concentration

Further information

This chemical is a pesticide product registered by the United States Environmental Protection Agency and is subject to certain labeling requirements under federal pesticide law. These requirements differ from the classification

criteria and hazard information required for safety data sheets, and for workplace labels of non-pesticide chemicals. The pesticide label also includes other important information, including directions for use. Following is the hazard information as required on the pesticide label: CAUTION: Harmful if swallowed. Harmful if absorbed through skin. Causes moderate eye irritation. Avoid contact with eyes, skin and clothing. Prolonged or frequently repeated skin contact may cause allergic reactions in some individuals.

Section 16 - OTHER INFORMATION

Further information

Creosote (P2) is registered only for pressure treatment of wood. Wood treaters must not knowingly pressure treat wood commodities that are not encompassed by the following use category table, which provides examples from the American Wood Protection Association (AWPA) Use Category System, as set forth in the most current edition of the AWPA Book of Standards.

NFPA Ratings

Vulcan CHEMICALS
A Business Group of Vulcan Materials Co

MATERIAL SAFETY DATA SHEET

24 Hour Emergency Phone 316/524-5751

SECTION 1 CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME
GLAZD® Penta, Block Penta

CHEMICAL NAME
Pentachlorophenol

SYNONYMS
Penta, PCP, Technical Grade PCP, Chlorophenols, Solid

MANUFACTURER
Vulcan Chemicals, P O Box 385015, Birmingham, AL 35238-5015

SECTION 2 COMPOSITION INFORMATION ON INGREDIENTS

CHEMICAL NAME	CAS NUMBER	% RANGE	OSHA PEL
* Pentachlorophenol	87-86-5	83-93	0.5 mg/m^3
2, 3, 4, 6-Tetrachlorophenol	58-90-2	0.6-3.0	None
Other chlorophenols and related compounds		3.5-12.0	None
Chlorinated impurities		0-4.0	None

* Denotes chemical subject to reporting requirements of Section 313 of Title III of the 1986 Superfund Amendments and Reauthorization Act (SARA) and 40 CFR Part 372

SECTION 3 HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Light brown or tan flake or solid
DANGER! May be fatal if swallowed, inhaled or absorbed through skin.
Causes skin and eye irritation. Causes delayed chemical burns.

POTENTIAL HEALTH EFFECTS

INHALATION
Inhalation is a major potential route of exposure. Symptoms of overexposure include rapid heartbeat and respiration, elevated temperature and blood pressure, muscular weakness, excessive sweating, dizziness and nausea. High concentrations can cause unconsciousness, convulsions and death generally from cardiac arrest.

SKIN
Pentachlorophenol is readily absorbed through intact skin. Pentachlorophenol in solution can be readily absorbed through intact skin in toxic amounts, causing systemic poisoning and symptoms described in the Inhalation section above. Pentachlorophenol on the skin can cause irritation.

EYE
Pentachlorophenol causes irritation of the eyes at 1 mg/m^3. If exposure is prolonged, slight transient corneal damage can occur.

INGESTION
Single dose toxicity is high. Symptoms of ingestion are those described in the Inhalation section.

CHLORACNE

In humans, the absorption of pentachlorophenol by any route may result in the development of the skin condition, chloracne. This usually appears as blackheads, whiteheads and yellow cysts over the temples and around the ears. In severe cases, involvement may be extensive. Mild cases may be similar in appearance to other forms of acne and to skin changes commonly seen with aging.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE

Acute or chronic kidney or liver disease, asthma, bronchitis, chronic acne and other skin conditions.

CHRONIC EFFECTS

The finding of chronic toxic effects in laboratory animals may indicate toxicity to humans. Overexposure should be avoided, failure to do so could result in injury, illness or even death. Chronic overexposure to technical grade pentachlorophenol has caused liver and kidney toxic effects in experimental animals.

SECTION 4 FIRST AID MEASURES

INHALATION

Move victim to fresh air. If breathing has stopped, administer artificial respiration. Call a physician.

SKIN

Remove contaminated clothing and shoes. Wash skin thoroughly with soap and water for at least 15 minutes. Wash contaminated clothing before reuse.

EYES

Flush eyes immediately with water for at least 15 minutes. Contact a physician.

INGESTION

Call a physician or Poison Control Center immediately. If possible, vomiting should be induced under medical supervision. Drink one or two glasses of water and induce vomiting by touching the back of throat with finger. Do not induce vomiting or give anything by mouth to an unconscious person.

NOTES TO PHYSICIAN

This product is a metabolic stimulant. Treatment is supportive. Forced diuresis may be effective to reduce total body burden. Treat hyperthermia with physical measures. Do not administer aspirin, phenothiazines, or atropine since they may enhance toxicity.

See Section 11 for Toxicological Information

SECTION 5 FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES

FLASH POINT

None

FLAMMABLE LIMITS IN AIR (PERCENT BY VOLUME)

None

HAZARDOUS COMBUSTION PRODUCTS

Hydrogen chloride, chlorinated phenols, and carbon monoxide

EXTINGUISHING MEDIA

Use dry chemical, foam, carbon dioxide or water spray. Water may be ineffective.

FIRE FIGHTING INSTRUCTIONS

Extinguish fire using agent suitable for surrounding fire. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Use water spray to keep fire-exposed containers cool.

Toxic gases are formed by thermal decomposition. Firefighters should wear self-contained positive pressure breathing apparatus, and avoid skin contact.

SECTION 6 ACCIDENTAL RELEASE MEASURES

Ventilate spill area and avoid breathing dust or vapors. Clean up spilled material (wear protective equipment - See Section VII) and place in closed container for normal use if possible or proper disposal. Penta is toxic to fish and wildlife; do not allow to contaminate ground or surface waters. Notify National Response Center (800/424-8802) of uncontained releases to the environment in excess of the RQ.

SECTION 7 HANDLING AND STORAGE

HANDLING

Avoid contact with skin and breathing dust. Do not eat, drink, or smoke in work area. Wash hands prior to eating, drinking or using restroom. Shower and change into uncontaminated clothing before leaving work premises. (Refer to Section 8).

Follow protective controls set forth in Section 8 when handling this product. Thoroughly wash potentially contaminated clothing before reuse. Do not launder work clothes with other non-contaminated clothes and/or household laundry. Contaminated clothing, boots or equipment should not be taken home.

STORAGE

STORAGE CONDITIONS

Store in properly labeled containers in dry, well ventilated secure area. Do not remove or deface label. Do not reuse drums for any purpose.

INCOMPATIBLE MATERIALS FOR STORAGE OR TRANSPORT

SECTION 8 EXPOSURE CONTROLS, PERSONAL PROTECTION

ENGINEERING CONTROLS

VENTILATION

Do not use in closed or confined space. Open doors and/or windows. Use ventilation to maintain exposure levels below 0.5 mg/m^3.

To determine the exposure level(s), monitoring should be performed regularly.

PERSONAL PROTECTIVE EQUIPMENT

EYE AND FACE PROTECTION

Wear safety glasses. Contact lenses should not be worn. When mixing penta solutions, wear chemical goggles and/or face shield.

SKIN PROTECTION

Wear PVC, neoprene, nitrile latex or equivalent gloves and tightly woven clothing including long sleeve shirt when handling flake or solid penta. When mixing penta solutions, wear protective clothing, gloves and boots or shoes, which are suitable for the solvent being used.

RESPIRATORY PROTECTION

Where concentrations of pentachlorophenol exceed or are likely to exceed 0.5 mg/m^3, a NIOSH approved organic vapor-dust filter type respirator is acceptable for concentrations up to 2.5 mg/m^3. A NIOSH approved self-contained breathing apparatus or air line respirator, with full face piece, is required for concentrations above 2.5 mg/m^3, or during emergency and spills. Follow applicable respirator use standards and regulations.

GENERAL
Safety shower and eye wash station should be available. Note: Protective equipment and clothing should be selected, used, and maintained according to applicable standards and regulations. For further information, contact the clothing or equipment manufacturer or the Vulcan Chemicals Technical Service Department.

EXPOSURE GUIDELINES

ACGIH: 0.5 mg/m^3 8 hour TWA
OSHA: 0.5 mg/m^3 8 hour TWA
(skin absorption possible)

ACGIH Biological Exposure Indices
(2 mg/L urine)
(5 mg/L plasma)

IMMEDIATELY DANGEROUS TO LIFE OR HEALTH
2.5 mg/m^3

ODOR THRESHOLD
Odor thresholds for PCP solution at 30° and 60 °C were 857 and 12,000 µg/l, respectively.

SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

CHEMICAL FORMULA
C_6Cl_5OH

MOLECULAR WEIGHT
266.32

APPEARANCE AND ODOR
Light brown or tan flake or solid

SPECIFIC GRAVITY
Flake bulk density = 70 lbs/ft^3

VAPOR PRESSURE
N/A

VOLATILES, PERCENT BY VOLUME
0

BOILING POINT
310°C (Melting Point: 190°C)

VAPOR DENSITY
N/A

EVAPORATION RATE
N/A

SOLUBILITY IN WATER
14 ppm @ 20°C

SECTION 10 STABILITY AND REACTIVITY

CHEMICAL STABILITY
Stable

CONDITIONS TO AVOID
Avoid contact with open flame, electric arcs, or other hot surfaces which can cause thermal decomposition.

INCOMPATIBILITY WITH OTHER MATERIALS
Strong oxidizers and alkalis.

HAZARDOUS DECOMPOSITION PRODUCTS
Hydrogen chloride, chlorine, chlorinated hydrocarbons

HAZARDOUS POLYMERIZATION
Will not occur.

SECTION 11 TOXICOLOGICAL INFORMATION

ACUTE TOXICITY
NOTE: The hazards of this product are based on studies on this or similar products.

INHALATION

Concentrations of 0.3 mg/m^3 can cause nose irritation. Concentrations above 1 mg/m^3 can cause irritation of upper respiratory tract with sneezing and coughing. Persons acclimated to pentachlorophenol can tolerate levels above 2 mg/m^3. Symptoms of overexposure include rapid heartbeat and respiration, elevated temperature and blood pressure, muscular weakness, excessive sweating, dizziness and nausea. High concentrations can cause unconsciousness, convulsions and death generally from cardiac arrest.

ANIMAL TOXICOLOGY

Oral LD_{50}: > 146-210 mg/kg (rat)
Dermal LD_{50}: > 96 mg/kg (rat)

CHRONIC TOXICITY

CARCINOGENICITY

Technical Grade Pentachlorophenol (penta) has been evaluated for possible cancer causing effects in laboratory animals. The National Toxicology Program fed up to 200 ppm Technical Grade (TG) penta and up to 600 ppm "purified" penta to mice, 7 days a week for 103 weeks. A statistically significant increased incidence of benign liver tumors was observed in male mice fed both types of penta. Increased benign liver tumors were observed only in females fed purified penta, and then only at the highest dose. Vascular tumors were observed in female mice, but not male mice. Increased incidence of benign tumors of the adrenal medulla were observed in both sexes of mice. Two other carcinogenicity studies, one in rats and one in mice failed to show increased incidence in tumors. In the rat study, rats were fed concentrations up to 30 mg/kg/day (approximately 750 ppm) for 2 years while the mouse study involved feeding of concentrations up to 46.4 mg/kg/day (approximately 600 ppm).

The International Agency for Research on Cancer (IARC) has concluded that, with respect to pentachlorophenol, there is sufficient evidence of the carcinogenicity to experimental animals, and inadequate evidence of the carcinogenicity to humans, resulting in a classification as a 2B animal carcinogen. Pentachlorophenol, 2,3,4,6-tetrachlorophenol and hydroxypolychlorodibenzo ethers are not listed on the NTP or OSHA carcinogen lists.

REPRODUCTIVE TOXICITY

Reproductive toxicity tests have been conducted to evaluate the potential adverse effects technical grade and purified pentachlorophenol may have on reproduction and offspring of laboratory animals. Both technical and purified pentachlorophenol have been found to be embryo and fetotoxic to rats, but not to hamsters. Neither technical grade nor purified pentachlorophenol caused teratogenic effects (birth defects), but did cause delays in normal fetal development. The EPA has expressed the opinion that pentachlorophenol can produce defects in the offspring of laboratory animals. Exposure to pentachlorophenol during pregnancy should be avoided.

NOTE: This product contains trace quantities of hexa, hepta and octachlorodibenzo-p-dioxins, hexa, hepta and octachlorodibenzofurans and hexachlorobenzene. The State of California has listed pentachlorophenol, hexachlorodibenzo dioxin and hexachlorobenzene under Proposition 65 as chemicals known to the State to cause cancer and hexachlorobenzene as a chemical known to the State to cause birth defects or other reproductive harm. If further information is desired, contact Vulcan Chemicals Technical Service Department.

SECTION 12 ECOLOGICAL INFORMATION

ENVIRONMENTAL FATE

Water: . If released in water, pentachlorophenol will adsorb to sediment, photodegrade (especially at higher pHs) and slowly biodegrade. Bioconcentration in fish will be moderate (bioconcentration factor range is 64-770). Biodegradation probably becomes significant after a period of acclimation (may be several weeks). Adsorption to sediments will be considerable. Hydrolysis and volatilization are not important processes in water.

Soil: Releases to soil can decrease in concentrations due to slow biodegradation and leaching into groundwater. Photolysis and hydrolysis of pentachlorophenol do not appear to be significant processes in soil. Pentachlorophenol released to soil will biodegrade with half-lives of weeks to months.

Air: Vapor phase pentachlorophenol will be lost by photolysis and to a lesser extent, reaction with photochemically produced hydroxyl radicals.

ECOTOXICITY

Acute LC_{50} (96 Hours, static) for Fathead Minnow: 205 µg/L
Acute LC_{50} (96 Hours, static) for Bluegill: 32 µg/L
Acute LC_{50} (96 Hours, static) for Sheepshead Minnow: 232-329 µg/L

SECTION 13 DISPOSAL CONSIDERATIONS

All disposals of this material must be done in accordance with local, state and Federal regulations. Waste characterization and compliance with disposal regulations are the responsibilities of the waste generator.

SPILL RESIDUES

Pesticide Disposal: Pesticide wastes are acutely hazardous. Improper disposal of excess pesticide, spray mixture or rinsate is a violation of federal law. If these wastes cannot be disposed of by use according to label instructions, contact your State Pesticide or Environmental Control Agency, or the Hazardous Waste representative at the nearest EPA regional office for guidance.

CONTAINER DISPOSAL

Completely empty drum or liner into application equipment. Triple rinse or clean empty drums, liners and block wrappings in accordance with 40 CFR 261.7(b)(3) prior to offering for reconditioning, recycling or other disposal. For guidance, contact the nearest EPA regional office or State Agency authorized to administer the Resource Conservation and Recovery Act (RCRA).

SECTION 14 TRANSPORT INFORMATION

INSPECTION AND SECURITY SCHEDULE
Cavenham Forest Industries LLC
Mobile, Alabama

1.0 INTRODUCTION

Presented herein is an inspection schedule for the Cavenham Forest Industries LLC (CFI) facility located in Mobile, Alabama. The facility conducts weekly and daily inspections during normal operation of the facility; however, inspections with written documentation are performed on a regular schedule to ensure proper operation and maintenance of the monitoring systems and facilities.

A report is filed at the facility detailing each inspection. These reports include the date and time the inspection occurred, the name of the person performing the inspection, and any defects observed. Once the defect is corrected, the date and a brief discussion of the actions taken are recorded on the inspection form. An example of an inspection log that will be completed during each inspection is presented as Exhibit F-1.

2.0 INSPECTION FREQUENCY

Inspection of the final cover for the hazardous waste management area and any associated security and monitoring devices is conducted according to the following schedule:

Inspection Frequency	Time Period
1/ month	Remainder of Post-Closure

Inspections are also conducted after any major (25 year, 24-hour storm event) and after any hurricane.

3.0 INSPECTION GUIDANCE

The inspections focus on the security fence, the monitoring and remediation wells, and the final cover for closed hazardous waste units.

3.1 Security Fence Inspection

The fence surrounding the closure is inspected for defects that may breach security or offer a hazard to employees. The security fence is inspected to insure the following:

- All signs are legible and adequately fastened,
- Fence posts are vertical and properly anchored,

- Gate is securely locked, and fastening hardware is in good order,
- Proper tension of fence fabric and lower tension line,
- Fence fabric is properly secured to the fence post,
- Proper tension of fence parapet,
- Fence and parapet adequately secured to fence posts, and
- No tears in fence fabric,
- Emergency contact phone number, name and address of facility owner/operator is posted at access gates.

3.2 Monitor and Recovery Wells

Monitor and recovery wells are maintained to insure the quality of the groundwater samples. Each inspection consists of:

- Inspection of the exposed stand pipe to assure integrity,
- Inspection of the protective case to assure proper protection of the stand pipe,
- Inspection of the protective post and concrete pad, and
- Total well depth (to determine degree of siltation in wells that have a history of siltation or suffer from poor performance).

3.3 Gradient Control System

The water table within the hazardous waste management area is maintained such that a negative hydraulic gradient exists between the area inside and the surrounding aquifer. The Gradient Control System consists of internal piping and a collection sump with pump for maintaining the depressed water table. The system is inspected to insure proper operation of the pump and piping, including:

- Inspection of liquid-level pump control and calibration:
- Inspection to assure proper function of pump;
- Inspection to assure that effluent collection sump is free of excessive silt;

- Inspection to assure that sump pump discharge pipes are free of leaks; and
- Inspection of clean-out risers for cracked or missing caps.

3.4 Final Cover Inspection

The inspector observes the final cover of the hazardous waste management area for such defects as erosion gullies, loss of vegetated cover, cracking or settlement of the final cover, burrowing or other animal activities that may disturb the final cover, the presence of perennial woody vegetation, and slumping or sliding of the final cover.

TABLE F-1
Inspection and Security Schedule

Facility Inspection Schedule

TABLE F-1
Facility Inspection Schedule

ITEM	INSPECTION PARAMETERS	FREQUENCY[1]
Final Cap Vegetation	Bare or dead vegetation areas. Deep rooted or other non-grassy vegetation (i.e. young trees)	Monthly
Final Cap Integrity	Depressions. Sign of erosion. Cracks or holes. Rodent or animal burrows. Subsidence or slippage. Gas collection system.	Monthly
Drainage Ditches	Signs of erosion. Overgrown with vegetation or blockage.	Monthly
Survey Benchmarks	Signs of damage.	Monthly
Facility Fences, Gates, and Survey Markers	Damage to fence. Damage to gates. Deterioration of fence.	Monthly
Activated Carbon	Leakage. Corrosion. 2-foot freeboard. Evidence of overflow.	Monthly
Effluent System Piping	Leaking. Swelling. Corrosion.	Monthly
Effluent System Pumps	Leaking. Excessive vibration or noise.	Monthly
Monitor Wells	Signs of damage to guard posts, casing or pipe	Monthly
Recovery Wells	Signs of damage to guard posts, casing or pipe	Monthly
Injection Wells	Signs of damage, leaks or malfunctions	Monthly

NOTES: 1= Refers to section 2.0 of Facility Inspection Schedule text.

Inspection and Security Schedule

Facility Inspection Checklist

FACILITY INSPECTION CHECKLIST
Cavenham Forest Industries, Inc.
Mobile, Alabama

MONTH:_____ YEAR:_____

ITEM	STATUS PASS (P) or FAIL (F) WEEK 1	2	3	4	5	IF FAILED, RECOMMENDED REMEDIAL ACTION	DESCRIPTION OF REMEDIAL ACTION PERFORMED & DATE COMPLETED
SECURITY FENCE							
1. Fence within 5% of vertical.							
2. Fabric in good condition and all fabric ties present and connected. Top rail and bottom tension wire connected.							
3. All linepost, pull posts and gate posts are structurally sound and free of significant corrosion. Posts do not move significantly when pushed.							
4. All compression braces properly bolted and free from significant corrosion.							
5. Tension members properly tensioned and free from corrosion.							
6. Angle arms for barbed wire parapet securely attached to top of fence and free from corrosion. Three (3) continuous strands of barbed wire securely attached to angle arms.							
7. Gates in working order with all components meeting specifications as for fence. Gate kept locked.							
8. Warning signs in readable condition spaced a minimum of every 100 feet. Each sign securely attached at eye level with four (4) metal ties.							
DRAINAGE DITCHES AND NPDES OUTFALL							
9. All ditches free of excess debris, vegetation, siltation, oil, or oily sheen.							
10. Ditch side slopes free of sloughing, caving, or other signs of excessive erosion. Ditches vegetated above normal water levels.							
11. Inspect ditch bank for evidence of contaminant seeps or oily stains.							

FACILITY INSPECTION CHECKLIST
Cavenham Forest Industries, Inc.
Mobile, Alabama

FACILITY COVER							
12. Inspect grass for normal appearance (appearance dependent on season). Inspect any brown or bare patches for signs of insect infestation.							
13. All areas above normal ditch water elevations vegetated with appropriate cover species.							
14. Inspect cover for signs of any woody vegetation. Immediately remove any woody vegetation over 6" tall.							
15. Inspect cover for signs of excessive erosion such as gullying.							
16. Inspect cover for signs of failure such as sloughing, cracking, heaving, or other movement.							
17. Inspect rip-rap along facility cover for bare spots, sloughing or other movement.							
GAS VENTING SYSTEM							
18. All risers properly installed. Removed risers and use flexible wire or snake to check and, if necessary, clear inside of riser and below ground portions of the vent.							
BENCHMARKS							
19. Locate all benchmarks and inspect for signs of disturbance. Check to make certain brass caps are present and firmly secured.							
TOPSOIL DRAINAGE SYSTEM							
20. Unobstructed drain.							
21. Drain free from damage.							
22. Rip-rap at drain outlets in place.							
MONITORING WELLS							
23. Check for damage to guard posts, protective casing or riser pipe.							
24. Protective casing locked.							
RECOVERY WELLS							
25. Damage to recovery wells, protective casing or riser pipe.							
26. Protective casing secure.							

INJECTION WELLS							
27. Damage to guard posts, protective casing or riser pipe.							
28. Signs of leaks.							
29. Signs of malfunction or damage.							
GRADIENT CONTROL SYSTEM							
30. Inspection of liquid-level pump control.							
31. Sump pump functioning properly.							
32. Discharge piping free of leaks.							
33. Clean out risers have caps in place and are free of cracks, etc.							
GROUNDWATER TREATMENT UNIT							
34. No leaks observed from storage and treatment tanks, carbon towers, or recovered oil storage tank and associated piping and valves.							
35. All treatment and storage unit drainage valves are maintained in the closed position and locked as appropriate.							
36. All operating equipment such as pumps and motors are in good working order and show no signs of malfunction, such as lubricant leaks.							
37. Containment walls and floor are in good condition with no breaks or cracks.							
38. Storm water accumulation within bermed areas is visually free of potential site contaminants (i.e. no surface sheen).							
39. High level float switches within the treatment unit are free of obstruction, are in good working condition, and are working properly.							
40. The level of oil in the Recovered Oil Storage Tank is _____							

FACILITY INSPECTION CHECKLIST
Cavenham Forest Industries, Inc.
Mobile, Alabama

GENERAL HOUSEKEEPING							
41. All inside and outside work and storage areas are in a neat and orderly condition.							
42. All trash, garbage, and waste material on this site is regularly picked up and disposed of. There are no unsafe, unsightly, unsanitary, excessive accumulations.							
43. All equipment unused or in good, clean condition. a. 2 flat, square-edged shovels. b. 2 chemical cartridge respirators with organic vapor cartridges. Check expiration date. c. 2 spare organic vapor cartridges. Check expiration date. d. 4 disposable impermeable coveralls (Large size) e. 4 pair impermeable rubber gloves. f. 2 pair steel-toed rubber boots (1 pair size 10, and 1 pair size 12). g. 2 plastic hard hats. h. 2 pair protective eyewear. i. First-aid cabinet (check list on cabinet door). j. 2 bales of absorbent pads.

PERSONNEL TRAINING PLAN
Cavenham Forest Industries LLC
Mobile, Alabama

1.0 INTRODUCTION

The personnel training programs for Cavenham Forest Industries LLC (CFI) are designed to instruct employees in the proper precautions and handling procedures for the K001 hazardous waste that is managed at the site, and implementation of the proper emergency response procedures in the event of a spill, fire, or other hazard. The goal of the program is to insure the protection of human health and the environment through proper management of hazardous waste. This plan meets the regulatory requirements of ADEM Administrative Code Rule 335-14-5-.02(7).

Revised job descriptions for personnel employed at Cavenham's closed Mobile, Alabama facility are included in this plan as Exhibit G-1.

2.0 PURPOSE

This plan is written to establish procedures for the initial training and subsequent retraining of facility personnel in the proper techniques for handling, storing, shipping and disposing of hazardous wastes, and the hazards associated with hazardous waste. Special emphasis is placed on the listed waste K001 whenever possible. It is also written to establish procedures for the documentation required to substantiate training and retraining of facility personnel. A "facility" is defined as each individual operating and maintenance department within the complex.

3.0 RESPONSIBILITY

CFI is responsible for assuring operators and employees are trained in procedures involving the handling, storing, shipping and disposal of RCRA hazardous waste, with emphasis on K001, as appropriate. All operators and or employees are trained by instructors that are professionally qualified to provide this service.

Records are maintained by the personnel that substantiate the training and retraining required for handling, storing, shipping and disposal of hazardous waste. This includes the operating fundamentals training of all new operating personnel. It also includes documentation of any additional and/or annual classroom and on-the-job hazardous waste management training for new or regular personnel. This information is maintained by the employee and the personnel department of the employee's company. A copy of the training record is maintained on-site for each person working at the facility.

4.0 PROCEDURE

Facility personnel involved with the management of hazardous waste receive documented classroom and/or on-the-job training on proper techniques required to safely and effectively perform such activities and respond to emergency situations. All personnel have previously received the operating fundamentals training and a forty (40) hour Hazardous Waste Health and Safety classroom training course which meets the requirements of the Occupations Safety and Health Administration (OSHA) regulation 1910.120.

Hazardous waste training includes as a minimum for all personnel engaged in hazardous waste operations the following subjects:

- The definition and identification of hazardous wastes
- A brief overview of federal and state regulations regarding hazardous wastes

While the waste water treatment plant is operating, the following operational subjects are included in the on-the-job training program:

- Operational fundamentals training
- Implementation of the Contingency Plan
- Automatic shutdown/cut off systems on waste streams
- Emergency shutdown systems for an operating unit
- Response to fires or explosions
- Response to spills or other releases of hazardous waste
- Procedures for using, inspecting, repairing and replacing facility emergency and monitoring equipment

On-the-job training is conducted until the operator is assured of the workers' capabilities and understanding of the management of his/her work area as it relates to hazardous waste management. This training includes a review of the Material and Safety Data Sheets for the materials or waste constituents workers may be exposed to and, where applicable, address the following items:

- Appropriate D.O.T. regulations for shipping waste
- Operating hazardous waste treatment and disposal equipment and facilities

- Storing of hazardous waste including the appropriate containers and their use and markings
- Inspections of hazardous waste treatment, storage and disposal facilities
- Disposition of off-specification hazardous materials
- Disposition of spill clean up waste from a hazardous spill
- Loading and manifesting of hazardous waste for off-site disposal
- Disposition of equipment and containers contaminated with a hazardous material
- Principles of health and safety
- Personal protective equipment usage
- Management and disposal options for wastes
- Waste accumulation time periods and locations
- Review of Contingency Plan (Annually)

5.0 TIMING

Facility personnel working in a position which involves the storage, loading, inspection, treatment, handling and disposal of hazardous materials must successfully complete this course within six (6) months after assignment to the position. Retraining courses must be completed annually.

6.0 DOCUMENTATION

Copies of all training records for on-site personnel are kept in a file in the facility's office building. To document training, these records include final certificates, sign-up sheets, and courses' names, dates and subject areas.

EXHIBIT G-1

Job Descriptions

CAVENHAM FOREST INDUSTRIES LLC
MOBILE, ALABAMA

NAME: James Davis

JOB TITLE: ENVIRONMENTAL SUPERVISOR

JOB DESCRIPTION: The Environmental Supervisor coordinates the day-to day activities at the site of contractors, consultants and other employees. A listing of some of the specific duties are provided below:

- Assignment of daily tasks for Environmental Technicians that are working at the site.
- Maintenance of site files containing copies of the Permits, manifests, and correspondence with agencies. Completion of discharge monitoring reports.
- Coordination and implementation of site monitoring activities associated with corrective action, groundwater and surface water discharges (NPDES or State Discharge Permit).
- Supervision of contractors and consultants conducting work at the site.
- Coordination of employee physicals and personnel training.
- Instruction of employees on proper analytical procedures for conducting on site chemical analyses (pH, specific conductance, temperature, dissolved oxygen, oil and grease, and chemical oxygen demand).
- Scheduling of hazardous waste shipments and tracking of manifests.

TRAINING:

OSHA 40 hour health and safety training, initially; 8 hour annual refresher.

DOT hazardous material transportation training at least once every two (2) years.

Site specific RCRA training. Includes initial and annual review of Contingency Plan, SPCC Plan, operation and maintenance discussions, groundwater monitoring, and manifesting.

CAVENHAM FOREST INDUSTRIES LLC
MOBILE, AL

NAME: JEFF GONSOULIN

JOB TITLE: ENVIRONMENTAL TECHNICIAN

JOB DESCRIPTION: The Environmental Technician assists the Environmental Supervisor in monitoring and maintenance activities. A listing of some of the specific duties are provided below:

- Assist Environmental Supervisor in site monitoring activities associated with corrective action, groundwater and surface water discharges (NPDES or State Discharge Permit).
- Maintenance of the various components of the water treatment system (compressors, pumps, valves, etc).
- Maintenance of the site grounds including seeding, grass cutting, and erosion repair and control. Operation, maintenance and repair of tractor and backhoe.
- Maintenance, installation and replacement of pumps, valves, meters and other groundwater corrective action system components.
- Provide monitoring, operation, maintenance and preventive maintenance of the water treatment system.

TRAINING:

OSHA 40 hour health and safety training, initially; 8 hour annual refresher.

DOT hazardous material transportation training at least once every two (2) years.

Site specific RCRA training. Includes initial and annual review of Contingency Plan, SPCC Plan, operation and maintenance discussions, groundwater monitoring, and manifesting.

Montgomery, Alabama 36110

Re: CAMU Certification Report
Cavenham Forest Industries, Inc. - Mobile, AL
ALD 057 226 904

Dear Mr. Molires:

In April 1995, Cavenham Forest Industries, Inc. (CFI) requested a modification to their Hazardous Waste Permit for the site referenced above to conduct on-site treatment of the surficial soils. The project included the permitting and construction of two corrective action management units (CAMUs) for management of the soils, treatment of soils excavated from several of the solid waste management units and areas of concern, and closure of the CAMUs. CFI has completed the project and the attached report provides documentation of the on-site activities and Certification of Closure.

If you have questions or require additional information, please call either Winston Russell or Clyde Woodward at (601) 544-3674.

Sincerely,

ENVIRONMENTAL MANAGEMENT SERVICES, INC.

C. Winston Russell, P.G.
Vice President

EXECUTIVE SUMMARY

In April, 1995, Cavenham Forest Industries, Inc. (CFI) requested a modification to Hazardous Waste Post-Closure Permit ALD 057 226 904, which governs post closure care and corrective action for the closed hazardous waste management units, solid waste management units (SWMUs) and areas of concern (AOCs) identified at the Mobile, Alabama facility. The modification proposed an aggressive soil remediation program to remediate impacted soils located between ground surface and the water table, as identified in previous investigations.

The objective of the remediation was to reduce the concentration of wood treating constituents to below risk-based action levels in all areas of the site that have contaminated soil either exposed at the surface or present in the vadose zone. From an occupational health risk view this approach would alleviate worker exposure concerns and allow development of portions of the property. From a regulatory view, the action treated the soils in several solid waste management units and areas of concern to below health based standards, completing soil treatment in these areas and removing potential source contaminants that may migrate into the shallow groundwater.

The plans for the remediation project were presented to the Alabama Department of Environmental Management (ADEM) in 1995. The *Soil Corrective Action Work Plan (April 1995)* called for the construction of two (2) corrective action management units (CAMUs) at the facility. These CAMUs would be used for: 1) stockpiling on-site soils that required remediation; 2), as a staging area to separate debris from the soils; and 3), to serve as a treatment area for soils undergoing biological treatment. All soils placed within the CAMUs were treated to below risk-based action levels and subsequently returned to the areas from where they were excavated or used elsewhere on-site as general fill. Following completion of the soil remediation these CAMUs were closed in accordance with the Post-Closure Permit and *Soil Corrective Action Work Plan.*

Environmental Management Services, Inc. (EMS) was retained by CFI to ensure that the *Soil Corrective Action Work Plan* for the facility would be implemented as desired. EMS provided oversight of the CAMU construction activities, excavation of the targeted soil, operation of the CAMUs, and closure of the CAMUs. Based on observations, laboratory and field testing results, and the data presented herein, EMS certifies the facility has met the requirements as outlined in the *Soil Corrective Action Work Plan* of April 1995.

1.0 INTRODUCTION

Cavenham Forest Industries Inc. (CFI) maintains a closed site in Mobile, Alabama that formerly produced treated wood products. The manufacturing process utilized creosote and pentachlorophenol under elevated temperature and pressure for preservative treatment of poles and piling. Wood treatment operations at the site ceased in 1980, and the years since have been spent dismantling the former operations, closure of the operational waste management units, and conducting post-closure monitoring and remediation. These activities were done both prior to issuance and under the direction of Alabama Department of Environmental Management (ADEM) Hazardous Waste Management Post-Closure Permit (ALD 057 226 904), issued by ADEM on February 5, 1991. This certification report for soil corrective action activities describes work conducted under an April 1995 modification to the Post Closure Permit.

In April 1995, CFI proposed a modification to Post Closure Permit ALD 057 226 904 (Permit) to conduct on-site soil remediation. This modification, which permitted activities outlined in the *Soil Corrective Action Work Plan* (Plan), included:

- A modification of the site *Corrective Action Plan* (CAP) for soil;
- Designation of two Corrective Action Management Units (CAMU); and
- Submittal of risk-based action levels for cleanup of soils by bioremediation, including a "contained-in" decision.

The Permit modification enhanced and expedited soil bioremediation activities by including provisions for excavating on-site contaminated soils to the water table and moving the soils to two permitted Corrective Action Management Units (CAMUs) for treatment. Within the CAMUs, the soils were treated using biological composting techniques to reduce the concentrations of wood treating constituents to below risk-based action levels.

Following ADEM approval of the Permit modification in December 1996, the two CAMU units were constructed as proposed in the Plan: the North CAMU and Central CAMU areas. The North CAMU was designed to serve as the primary soil treatment area, while the Central CAMU acted as a soil screening, stockpiling and staging area. The soils treated within these CAMUs were excavated from areas identified as Solid Waste Management Units (SWMU) and Areas of Concern (AOC) in the RCRA Facility Assessment (RFA).

Within the CAMUs, the soils were screened to remove debris, shaped into windrows, and bioremediated to meet the established health-based cleanup criteria. The bioremediated soils were then sampled to confirm that cleanup criteria were achieved before returning the soils to the excavated areas on-site. A total of approximately 32,365 cubic yards of contaminated soil were excavated and treated in the CAMUs. Soil screening in the Central CAMU began in November 1997 and final treatment of all soil was completed in January 2002.

The CAMUs were closed in accordance with Section 9.0 of the Plan following treatment of the final windrow of soil. The closure included removal of all treated soils, decontamination and disposal of the North CAMU geomembrane, cleanout of the stormwater collection tanks used in the operation of the CAMUs, laboratory analysis of soils beneath the North CAMU, and grading and seeding the site.

2.0 SITE LOCATION

CFI's Mobile facility is positioned near north latitude 30° 43' 46" and west longitude 88° 03' 01" on the north side of the city of Mobile, Alabama. The facility's physical address is the south end of Herbert Street and it is located just south of the Herbert Street intersection with Bay Bridge Road (see Figure 1).

The site is situated in a principally flat, low lying area, with site elevation ranging between 0 and 16 feet relative to the National Geodetic Vertical Datum (NGVD), the greater elevations being associated with the closed hazardous waste landfill. The site is in an industrial area that is bounded on the north by the Star Paper Company warehouse area and on the west by Kimberly-Clark (formerly Scott Paper Company) solid waste landfill and warehouse. The east boundary of the site is an elevated railroad embankment. Immediately east of this embankment is the EOTT Energy petroleum bulk storage facility. The southern border of the property is Three Mile Creek. South of Three Mile Creek on the opposite bank from the facility is a marine dock and railroad yard operated by the State of Alabama.

3.0 OBJECTIVES

The *Corrective Action Plan* (CAP) of July 1992 identified three areas where in-situ bioremediation of wastes would occur: the North Tar Deposit Area, the Creek Tar Deposit Area, and the Central Area (referred to as Cylinder Area in the CAP). Following approval of the CAP, a fourth area of contaminated soil was identified at the site, referred to as the New Area Behind Tank Farm. The *Soil Corrective Action Plan* (Plan) of April 1995 included all four of these areas as sites for bioremediation. Preliminary soil volume calculations estimated that approximately 30,000 cubic yards of soil were contained in the four areas identified:

Name	Estimated Soil Volume (cy)
Central Area	22,000
North Area	2,600
South Area	4,000
New Area Behind Tank Farm	1,400

These areas and the associated regulated units as identified in the RFA are listed in Table 1 and shown on the Estimated Extents of Regulated Units, Figure 2.

The primary objective of the amended Plan (April 1995) was to excavate and bioremediate the contaminated soils from the four principal contamination areas identified above. A secondary objective was to consolidate the bioremediated soils in the Central CAMU; however, the Permit did not require this activity and the treated soil was placed back into the area from which it was excavated or used as general fill at other on-site locations.

Site-specific soil contamination risk-based action levels (RBALs) were developed for the bioremediation activities. The RBALs were provided to ADEM in the document Health Risk-Based Action Levels (FWENC, April 1995). These soil RBALs were established as follows:

- 25 milligrams per kilogram (mg/kg) for the total carcinogenic poly aromatic hydrocarbons (PAHs)
- 250 mg/kg for the total noncarcinogenic PAHs
- 15 mg/kg for pentachlorophenol
- 65,000 mg/kg for 2,4,6-Trichlorophenol.

These constituents and the associated RBALs are shown in Table 2.

As further described below, to meet the RBALs for carcinogenic and non-carcinogenic PAH levels, a two phased soil bioremediation program was implemented to treat the contaminated soils.

3.1 Initial Soil Bioremediation Program

The purpose of the initial soil bioremediation program was to demonstrate the feasibility of treating contaminated soils, to develop waste-specific degradation rates, and to optimize biotreatment methods/criteria. These activities were conducted within the central CAMU.

Contaminated soils were initially placed within the Central CAMU in a diked area approximately 120 feet wide and 650 feet long. The soils were placed in a single windrow, and bioremediated using soil amendments, bacteria, and mechanical disturbance during the construction of the North CAMU. Different operating scenarios were tried to help establish optimum bioremediation techniques. After the most efficient bioremediation methods were determined, the Central CAMU was used as an area to stockpile and screen the soils prior to transfer to the North CAMU for final treatment. The locations of the Central and North CAMU are indicated on Figure 3.

3.2 Final Soil Bioremediation Program

During the initial bioremediation phase, the North CAMU was constructed. This area was a bermed area that measured approximately 280 feet wide by 450 feet long and was underlain with a High Density Polyethylene (HDPE) geomembrane liner to protect the natural soils from the constituents of concern. The underlying soils and HDPE liner were further protected with an 18-inch soil work pad. Following screening to remove debris in the Central CAMU, soils with contaminant levels that exceeded the RBALs were placed in windrows in the North CAMU for treatment. The composting treatment process and schedule were determined by laboratory analytical results for RBAL constituents and were continuously refined during the project life.

4.0 CONSTRUCTION

The North and Central CAMUs were constructed between December 1996 and October 1997 at the locations indicated on Figure 3. The certification report, prepared by Aquaterra and submitted in March 1998 was titled *CAMU Construction Quality Assurance Documentation and Certification of Earthwork Construction.*

4.1 Central CAMU

The Central CAMU was constructed by creating a 2-foot high berm east, north, and south of the operating area. The north and south berms interconnected with the east RCRA facility road to form a complete containment area, approximately 120 feet wide by 650 feet long. Within the containment area, an excavation was made to the top of the sand in the T-2 groundwater recovery French drain. The containment area sloped toward this excavation to allow the French drain to collect any stormwater impacted by contact with contaminated soils. Water collected in the French drain was pumped to one of the three storage tanks located in the tank farm north of the RCRA closure facility and ultimately to the on-site recovered groundwater treatment system.

4.2 North CAMU

Construction of the North CAMU included excavating and laboratory analysis of the subgrade, subgrade preparation and baseline sampling, a stormwater sedimentation basin, a liner protection base layer, a geomembrane lining system, a liquids handling system, decontamination area and vehicle access ramps, and a work pad. Figures 4, 5, and 6 show excavation locations, sample locations, and a construction "As-Built" Plan for the North CAMU.

4.2.1 Excavation and Sampling of Subgrade

Prior to construction of the North CAMU, eight areas within the proposed CAMU foot print were excavated either due to the presence of contamination and/or due to the presence of material unsuitable for use as a sub-base. Subgrade soils were excavated within the footprint of the berm (see Section 4.2.3) and beneath a wood chip storage area. After removal of visually contaminated material, soil samples were collected and analyzed to confirm that the target constituent concentrations were below the approved action levels. Confirmation samples were collected from both the perimeter (samples labeled with a "P") and bottom (samples labeled with "B") of each excavation. If a perimeter or excavation bottom sample failed, the excavation was expanded and resampled until side wall and excavation bottom samples passed. Figure 4 shows the areas that were excavated and the confirmation sample locations. The results of the confirmation sampling program are summarized in Table 3 and the actual laboratory data sheets are presented in Appendix A.

4.2.2 Subgrade Preparation and Baseline Soil Sampling

Subgrade preparation included proof rolling of the construction area and grading the compacted fill to design elevations. Following subgrade preparation, baseline subgrade soil samples were collected and analyzed from the top six inches at 12 locations (BL-01 through BL-12). To verify the integrity of the CAMU liner system, confirmation samples (CBL-01 through CBL-12) were

collected at the same baseline locations after the CAMU was decommissioned. Figure 5 shows the baseline and confirmation sample locations. Both the baseline and confirmation samples were analyzed for the constituents presented in Table 2. Results of the sampling program are presented in Table 4 and the actual laboratory data sheets are presented in Appendix B.

4.2.3 Perimeter and Interior Berms

Imported clay material was used to construct the perimeter and interior berms. These berms were compacted and tested in six- to nine-inch lifts. The berms ranged from three to five feet in height.

4.2.4 Stormwater Sedimentation Basin

A sedimentation basin was formed by the south perimeter berm and a single interior berm. North to south drainage laterals were installed at 50-foot intervals in the treatment area as shown in Figure 6. These drainage laterals were installed on top of the geomembrane liner and connected to a header trench drain installed along the southern interior berm. The header trench emptied into the east end of the sedimentation basin. This basin served as a stormwater collection area designed to allow sufficient retention time for suspended solids to settle prior to recovery. The basin included three concrete weirs designed to retard the flow of stormwater through the sedimentation basin and allow sediments to settle prior to reaching the collection sump near the southwest corner of the unit.

4.2.5 Liner Protection Basin Layer

Prior to the installation of a HDPE geomembrane liner, a four-inch protective layer of fine sand was placed on the prepared subgrade. This layer's purpose was to insure that any material prevalent in the prepared or in-situ subgrade would not puncture the liner.

4.2.6 Geomembrane Lining System

A 60-mil HDPE liner was installed throughout the North CAMU to ensure that the subgrade soils would not be contaminated during biological treatment.

A certification letter from Aquaterra Engineering entitled "CAMU *Construction Quality Assurance Certification of Geosynthetics Liner Installation*", dated July 29, 1997 detailed the liner installation process.

4.2.7 Liquids Handling System

A moisture addition system, as shown in Figure 6, was installed to hydrate the contaminated soils as warranted. This system was connected to the header drain trench located along the southern interior dike, and utilized recycled stormwater. Liquids were handled with pump controllers, level indicators and flow meters.

4.2.8 Decontamination Area and Vehicle Access Ramps

A decontamination pad was installed along the west end of the sedimentation basin. The decontamination pad included a double layer of 12-ounce woven geotextile to protect the underlying HDPE geomembrane liner; approximately 1.5 feet of sand; an 8-ounce woven geotextile; and a layer of crushed limestone. Ramps for access to the decontamination pad and access to the east side of the North CAMU were constructed of crushed limestone. Prior to placing the limestone, a double layer of 12-ounce woven geotextile and 12 inches of clayey sand were placed to protect the underlying HDPE geomembrane liner.

4.2.9 Work Pad

An 18-inch thick work pad was placed on top of the 60-mil HDPE liner as protection for windrow operations. As described in Section 4.2.4, drainage laterals were constructed within the work pad to facilitate the flow of liquids to the header trench drain. The work pad consisted of contaminated sandy soils excavated from select areas on site. These sandy soils were screened prior to placement in order to remove any debris larger then two inches and ferrous metals.

4.3 Construction Certification

Certification of the North CAMU construction is detailed in a March 1998 Aquaterra Engineering document titled *CAMU Construction Quality Assurance Documentation and Certification of Earthwork Construction.*

5.0 CENTRAL CAMU OPERATIONS

All areas were cleared and grubbed clean of debris before any soils were excavated. Further discussion of the treatment of this debris is presented in Section 7.3. Operations at the Central CAMU were characterized by screening and stockpiling excavated contaminated soils.

5.1 Soil Excavating

The biotreatment operation began with excavation of the contaminated soil found within the North Area, South Area, and Central Area. Once soil was excavated, it was loaded and transported to the Central Area, where debris was removed by the shaker screen described in Section 5.2. Soils in the North Area and South Area were excavated and processed for treatment in the North CAMU before the Central Area soils were excavated.

The presence of odor and visual staining were the principal methods for determining whether soils were to either be sampled or excavated. Those soils with obvious visual staining or odors were excavated for treatment. Following excavation, the areas around the excavation were sampled to insure compliance with the Plan. Descriptions of the excavation and sampling in the individual areas are described in Section 7.

Portable dewatering pumps were located in the excavation areas during construction activities to remove accumulated stormwater. Water was pumped to the North CAMU collection sump or directly to the storage tanks using above ground temporary piping. Pipelines entered the tanks from the top (to prevent back flow) and were continuously inspected during pumping.

5.2 Soil Screening

After transport from the excavations, the contaminated soil was screened using a twin shaker screen (manufactured by Power Screen, Inc). The first screen removed coarse debris (approximately six inches by six inches and larger) and the second screen removed debris larger than two inches. The screened soil was transferred to either a dump truck or to a soil stockpile using a conveyor belt. The conveyor belt transferred the soil and also removed ferrous metals via an electromagnet. The screening operation was located within the Central Area CAMU so that soils could be screened, then temporarily stockpiled.

Material retained by the shaker screens consisted mainly of broken pieces of creosote treated piling, rail ties, and utility poles, but also included roots and other debris generated from the soil screening process. The woody material was pulverized by a mobile unit that delivered the processed material to a waiting dump truck. The dump truck delivered the material to the North CAMU for treatment.

After contaminated soils were screened and stockpiled in the Central CAMU, they were transported to the North CAMU for biological treatment.

6.0 NORTH CAMU BIOTREATMENT OPERATIONS

Contaminated soils transported from the Central CAMU underwent biological treatment in the North CAMU. The bioremediation process was operated in a "batch mode" cycle, as much as possible. In the batch mode operation, all completed windrows are removed at the same time, when biological treatment has been completed on all windrows in that "batch". However, there were numerous times when some windrows from the batch would pass and be removed while others remained on the work pad to undergo further treatment.

6.1 Organic Amendments

Organic amendments were used to accelerate biodegradation within the windrows by stimulating microbial activity and enhancing constituent degradation rates. Organic materials included chicken manure, fish processing waste, cotton processing waste, wood chips, sawdust and grass clippings. These organic amendments were typically added to the screened soil as the windrows were being formed. The amendment delivery and staging area was located on the west side of the North CAMU. The amendments were loaded onto the pad by backing the delivery truck over the pad and dumping onto the pad. A front-end loader inside the CAMU moved the amendments from the edge of the pad to the windrow.

6.2 Other Soil Amendments

Other soil amendments added to the windrows less frequently than the organic amendments included inorganic fertilizers, lime, and surfactant. Fertilizers were applied by broadcasting (solid) or spraying (liquid). Lime was applied by broadcasting and surfactant by spraying. These amendments were typically applied to the surface of windrows prior to turning.

6.3 Windrow Building

Soil requiring treatment was delivered to the North CAMU from the Central CAMU by dump truck. The soils were placed into the facility by backing the trucks up to the edge of the pad at the loading points (located on the east and west sides of the unit) and end-dumping the soil into the CAMU. From this point the soil was transported to the windrow by front-end loader.

Windrow building was typically accomplished as follows.

- Soil, bulking agents, and organic amendments were moved onto the composting pad with the front-end loader or other available equipment. Materials were dumped and formed in a designed sequence that resulted in a mix of materials.
- The windrow was mixed and aerated with a SCARAB composting machine.
- The edges of the windrow were re-formed with the front-end loader when necessary.

The windrows were a maximum of 360 feet long, approximately 14 feet wide at the base, four feet wide at the top, and five feet high. In some cases, the length of the windrows was shorter depending on the amount of contaminated soil being treated. The windrows were oriented in an east-west direction.

To identify and track windrow placement, each windrow location was assigned an alphabetic slot designation from A to H. Lot A was the northernmost windrow and H was the southernmost. Upon placement, each windrow was assigned a numeric designation corresponding to the batch number. The alphabetic slot designation and the batch number designation provided the windrow identification number. For example, the first batch placed in the northern most windrow location was designated WRA1. The "WR" indicating a windrow and the "A1" indicating this was the first windrow in the "A" location.

All material placed in the windrow was tracked and described in project reports. These reports included, at minimum, information on the area from which the soils were excavated, location of the windrow, and amount and type of amendments.

6.4 Windrow Turning

The windrows were periodically mixed by a SCARAB composting machine. Mixing the windrows helped control the temperature and the oxygen availability to maximize the bioremediation process. Generally, the windrows were turned once per week, or as weather permitted.

6.5 Moisture Control

Windrows were periodically watered to prevent drying of the surface and to maintain proper moisture content in the soils undergoing treatment. Moisture content was a critical operating parameter because the microbes must have sufficient water, but not excessive. Low moisture content restricts the growth of the microbes, while higher moisture content complicates soil handling and reduces oxygen transport. Moisture addition was accomplished by spraying with a hose or by the liquids handling system (See Section 4.2.7).

6.6 Operational Monitoring

CAMU operations were monitored to measure the physical, biological, and chemical parameters throughout the biodegradation process. Operational monitoring required both field and laboratory measurements. Each windrow was periodically monitored from the time of placement through final testing to ensure that the treated soils met the RBALs.

6.6.1 Windrow Field Parameters

Field parameters were established and monitored to ensure that existing conditions provided the most effective biological treatment. Moisture content, oxygen concentration and soil temperature in each windrow were measured with an electronic sample probe. Additionally, a pH meter was used periodically to measure the pH of the treated soils. Discrete monitoring stations near the middle and within 40 feet of the ends of each windrow were used for each monitoring event. Sample probes were generally advanced at each monitoring station perpendicular to the slope of the windrow at the midpoint between the toe and crest. Moisture content and oxygen concentration readings were collected approximately three and six feet into the windrow. Soil temperature readings were collected about two, four and six feet into the

windrow. Samples for pH were collected at a depth of approximately three feet at each monitoring station.

6.6.2 Windrow Laboratory Parameters

Nutrient analysis and microbial counts were measured periodically by collecting samples for laboratory analysis. Grab samples were collected at a depth of approximately three feet at each monitoring station. For each windrow, the grab samples were then combined to form a single composite sample for analysis.

Nutrient monitoring/analysis was performed to assess the optimal frequency of fertilizer application during the bioremediation process. Microbial counts were conducted to determine whether a sufficient number of colony forming units (cfu) existed to effectively attain the stated RBALs.

6.7 Treated Soil Confirmation Sampling and Analyses

Confirmation samples from each windrow were collected at the end of the scheduled treatment cycle. Soil samples were collected along the length of the windrow at approximate intervals within 40 feet of the ends and at the center along either side of each windrow. A grab sample was collected at an approximate depth of three feet into the slope of the windrow at each interval. These grab samples were combined to form a single composite sample. Samples were analyzed for the constituents listed in Table 2.

Samples were identified by a code that included the corresponding windrow identification and sample number. For example, a sample collected in the first batch from the most northern windrow would correspond to sample WRA1. In many cases, duplicate samples were taken and analyzed to insure the windrows had met the RBALs. Windrows with failing results continued treatment and were analyzed at a later date using the same sample number.

The noncarcinogenic and carcinogenic PAHs were summed and compared to the RBALs of 250 mg/kg and 25 mg/kg respectively. Similarly, concentrations for Pentachlorophenol and 2,4,6-Trichlorophenol were compared to their respective RBALs of 15 mg/kg and 65,000 mg/kg. If none of the values exceeded the associated RBAL, then the soil was considered adequately treated. If the confirmation samples did not meet the RBALs, then bioremediation would continue and the windrows would be resampled.

Table 5 presents the analytical summary of the windrow operations. This table shows the analytical results prior to biological treatment, results during operational testing, and results of confirmation sampling. The actual laboratory data sheets are presented in Appendix C.

As can be seen in Table 5, some of the windrows were analyzed several times before the windrow was considered to meet the RBALs. The table also shows that some of the material placed in windrows did not exceed the RBALs once the windrow was formed. In those cases, this material was handled in the same manner as final treated soils.

6.8 Treated Soil Backfilling

After confirmation sampling had shown that the soil had been treated to the RBALs, the soil was loaded into dump trucks using the front-end loader. The treated soil was transported around the site and end dumped into the various excavated areas. The dumped material was spread, compacted and shaped to promote drainage.

7.0 TREATED AREAS

Samples were collected during the excavation process to confirm that all contaminated soils had been removed from the targeted SWMUs and AOCs. Sampling was originally based on a stratified random sampling scheme. Each soil treatment area was divided into grid blocks. Each grid block was further divided into nine (three by three) sample squares. One sample square was randomly selected from each block, except that squares touching (along either the corner or side) a previously selected square or falling outside of the excavated area were eliminated from the pool of potential sample squares. This sampling approach provided a random, stratified sample even from a non-randomly distributed population.

In order to assure that the lateral extent of the excavation was sufficient, additional soil samples were taken along the perimeter of the excavation. Where possible, specific sample locations were selected so that perimeter samples were not adjacent to a selected sample square (unless the sample square showed obvious signs of contamination.) Otherwise, the sample points were selected in the following order of preference:

- A point exhibiting a drainage pathway,
- The lowest point along the perimeter segment,
- The center of the perimeter segment.

This sampling approach was conservative since sample selection within a randomly selected sample square or perimeter sample segment is biased towards the potentially most contaminated location. However, this sampling regimen was not followed in excavations that encountered groundwater. In those excavations, a sample was quickly collected before groundwater entered and potentially contaminated the sample.

7.1 North Area

In 1998, soil remediation activities were focused on the former North Tar Deposit area (SWMU 22) and the area immediately southeast and east of the North CAMU (Part of SWMU A). During the preparation stage of the excavation, two samples were collected along the perimeter (MO-NA-P01-NE and MO-NA-P02-NE) to a depth of approximately 12 inches and one at the groundwater level (MO-NA-B01-NE) in the proposed excavation area. The analytical results summarized in Table 6 and the data sheets presented in Appendix D indicate that these soils did not meet the RBALs. Sample analysis and odor detection were used in the northeast corner of the site around the T-1 Trench to determine the limits of the excavation, as shown on Figure 7.

Sheet piling was installed in the North Tar Deposit area on the south side of the subsurface oil pipelines that border the north property line. Contaminated soils to the south of the sheet piling were excavated to the depth of first-encountered groundwater, and were then screened and placed in the North CAMU for treatment. A soil sample and duplicate were collected from the bottom of the excavation (MO-NTBS1). The results of the sample and duplicate, including summary data sheets, are summarized in Table 6. The locations of the samples are shown on Figure 7. Approximately 4,050 cubic yards of the soils from this area were remediated during the first half of 1999.

7.2 South Area

In the latter half of 1999 and the first half of 2000, excavation and treatment focused on soils in four excavation areas on the south part of the site near Three Mile Creek (see Figure 7). These excavations targeted SWMU 23, parts of AOC A, and an 18–inch diameter culvert discovered during the excavation. The groundwater table in each of these areas was very shallow. Excavation in these areas was limited to depth of first encountered groundwater.

Seventeen soil samples (MO-SWTP-01 through MO-SWTP-17) were collected around the excavations toward the southwest to assess the boundaries of these excavations (see Figure 7). Samples in these locations were generally collected in the upper 12 inches of the soil. Analytical results are summarized in Table 7 and the laboratory data sheets are presented in Appendix E.

During excavation, seven bottom samples (SW-7-BS1 through SW-7-BS6) collected taken along the north side of the excavation before groundwater was encountered. Sample SW-7-BS3 exceeded the RBALs, and the excavation was deepened in this area. A follow-up sample was collected near SW-7-BS3 on SWWS-1-6 to demonstrate that the soil at the bottom of the excavation was below the RBALs.

Soil from two additional, relatively small, areas was excavated and treated, based on odor detection. One of the areas is associated with SWMU 23 and the other is associated with the 18-inch culvert that was discovered in this area during the excavations associated with SWMU 23. Three upper 12-inch soil samples (MO-P-1W, MO-P-2C, MO-P-3E) did not show the soils in this area to exceed the RBALs, see Table 7. The area was excavated to slightly below the ground water table.

The sample locations and an outline of the excavated areas are presented on Figure 7. Results of the analytical data are summarized in Table 7. Laboratory data sheets are presented in Appendix E.

Approximately 2,820 cubic yards of soils were excavated from the area south of the water treatment area.

7.3 Central Area

During 1997 and 1998, soil between the North CAMU and the Central CAMU, and the North CAMU and the Hazardous Waste Management Area were excavated at various locations to remediate the SWMUs and AOCs identified in the Central Area. Bottom and perimeter samples, MO-CA-B01, MO-CA-B02, MO-CA-B03, MO-CA-D01, MO-CA-B04, BS1-51298-12, BS1-51298-6, BS251298-6, MO-CA-P1-S, MO-CA-P2-W, MO-CA-P3-W, MO-CABS-1, MO-CA4-B1, MO-CA4-B1, and MO-CA4-B2, were collected within the excavation. Analytical summaries of these samples are presented in Table 8. Appendix F contains the supporting laboratory data sheets. The locations of these samples are presented on Figure 7. Olfaction and laboratory analysis of these samples were used to determine the extent of the excavations as shown on Figure 7.

In 1998, CFI employed a contractor to grind the stockpile of woody debris material that had been generated while screening material from the areas excavated throughout the site. The materials consisted mainly of broken pieces of creosote treated piling, rail ties, and utility poles, but also included roots and other debris generated from the soil screening process. This material was pulverized by a mobile unit that delivered the processed material to a waiting dump truck. The dump truck delivered the material to the North CAMU for treatment.

Also in 1998, approximately 3,700 cubic yards of screened materials cleared from the area to the east and southeast of the Central CAMU were sent to the North CAMU for treatment. Approximately 6,040 cubic yards of soil from the Central Area were excavated and sent to the North CAMU for treatment.

During 1999, approximately 2,630 cubic yards were excavated and treated from the east side of the site between the main stormwater discharge ditch and the Central CAMU. During 2000 and 2001, soils and the work pad from the Central CAMU were excavated and treated.

Also in 1999, soils were excavated and treated from the east side of the site between the main stormwater discharge ditch and the Central CAMU. The extent to which these areas were excavated was determined by olfaction, groundwater levels and from sample analysis. Samples MO-CA6-BS1, MO-CA6-BS2, MO-CA6-BS3, CTDRS1-5, CTDBS-1, and CTDBS-2-4 were collected in the bottom of the excavations to verify that clean soil had been reached. The extent of these two excavations and sample locations are included on Figure 7. Analytical results are summarized in Table 8. Appendix F includes supporting laboratory data sheets.

During the excavation and treatment of soils in the Central Area, a number of near surface soil samples, collected from six to 12 inches below grade, were collected to determine whether the soils exceeded the RBALs. These samples include: MO-CA5B1-6, MO-CA5B2-6, MO-CA-5B3-6, MO-CA-5B4-6, MO-CA-DL-B1 and MO-PH-TS. Sample locations are presented in Figure 7. The analytical summary in Table 8 and the supporting laboratory data sheets in Appendix F indicate that contaminants in these areas did not exceed the RBALs. Consequently, excavation and treatment of soils in those areas was not necessary.

In total, approximately 23,770 cubic yards of soils were excavated and treated from the Central Area.

7.4 New Area Behind Tank Farm

EMS excavated soils in SWMU 27 (New Area Behind Tank Farm) in April 1998. This soil was transferred to the North CAMU following construction and used as part of the 18-inch soil base upon which windrows were constructed. The excavation was immediately filled with imported soil. No treatment of the soils was attempted in this area due the high groundwater table. Instead, four recovery wells, RW-29 through RW-32 as shown on Figure 7, were installed. Documentation of the installation of these wells was presented in Section 3.2 of EMS'

Corrective Action Plan Modification Report, Cavenham Forest Industries Inc., Mobile, Alabama Facility, dated February 6, 2003.

7.5 18-Inch Diameter Culvert

As further discussed in correspondence to ADEM dated November 1, 1999, CFI discovered a north/south trending 18-inch diameter culvert composed of concrete in some areas and metal in others south of the water treatment area. The area south of the water treatment plant was excavated as shown on Figure 7 to slightly below the water table and the soils treated in the CAMU. During December, 2002, CFI used a Geoprobe to investigate the subsurface soils on the north side of the water treatment area, completing borings SB-38 through SB-43 (Figure 7). Soils samples were collected from each boring and submitted to CFI's contract laboratory and analyzed for the RBAL constituents. As indicated in the analytical summary, Table 9, RBAL constituents were not detected in any of these samples. The laboratory analytical report for these samples is provided in Appendix G.

8.0 CLOSURE OF CAMUs

When bioremediation was completed, the CAMUs were closed as required by 40 CFR §264.552(e)(4) and ADEM ACR 335-14-5.19(1)(e)(4). The CAMUs were clean closed in accordance with Section 9.0 of the *Soil Corrective Action Work Plan* of April 1995.

8.1 Closure of Central CAMU

The Central Area CAMU was closed by removing the initial test windrow and all of the soil stockpiles and treating this material in the North CAMU. The soil screening unit and conveyor unit were decontaminated and moved to an off-site location. Woody debris removed from the screening process was pulverized into small particles and treated within the North CAMU. Stone and concrete debris were decontaminated, as warranted, and used as general fill at on-site locations. Liquids were transferred to the stormwater collection tanks and ultimately routed to the on-site groundwater recovery treatment system which has a permitted NPDES discharge. The Central Area was backfilled following excavation of contaminated soils to a positive slope that will promote non-erosive runoff. Following grading, the area was seeded with suitable annual and perennial grasses and mulched.

Prior to final grading of the soil, samples were collected throughout the Central CAMU. These samples, MO-CC-B1-6', MO-CCBS-2, MO-CCP-2, MO-CCBS-2, MO-CCP-2, MO-CC BS3, MO-CC BS-4, MO-CC P3, MO-CC TP-1, MO-CC TP-2, and MO-CC TP-3, were collected to a depth of six to 12 inches. The sample locations are shown on Figure 7. The analytical summary is presented in Table 10 and the individual laboratory data sheets are presented in Appendix H. The results presented in Table 10 show that the analyzed constituents were below the RBALs prior to grading the area with treated soil.

8.2 Closure of North CAMU

The North CAMU was closed by treating all soil windrows and the soil work pad contained within the CAMU, decontaminating, removing and disposal of the geomembrane, and then confirmatory sampling of the underlying soil.

8.2.1 Decontamination and Removal

After completing treatment of the last windrow, the working pad and protective sand were formed into windrows on the southern end of the CAMU. This material was biologically treated and sampled in the same manner as previously conducted for contaminated soils. When treatment of these materials was complete, the sand and work pad were excavated, loaded, and spread on-site.

Equipment, vehicles, and project materials were decontaminated after all treated materials had been spread. The CAMU HDPE geomembrane liner and decontamination facility were decontaminated by using high-pressure water, steam, and/or detergents. The HDPE geomembrane liner was rolled out and sprayed with a high pressure washer to remove significant solids. The HDPE liner was then wipe-tested and found to have some Table 2 constituents. The HDPE liner was then cut into pieces, which were repeatedly immersed in a tank filled with water

and detergent. While suspended above the tank, the HDPE was again pressure washed. After subsequent wipe tests indicated that the HDPE liner had been successfully decontaminated, it was disposed as construction debris in a solid waste disposal facility. Results of the wipe tests are presented in Table 11. Analytical data sheets are presented in Appendix I along with copies of manifest and ADEM correspondence regarding the HDPE liner disposal. Wash water from this process was routed to the on-site recovered groundwater treatment system.

The decontamination equipment, piping, drains, pumps, and collection sump were dismantled, decontaminated, and stored for future use.

Sediments collected in the stormwater storage tanks were analyzed for the soil treatment RBAL parameters. As indicated by the data presented in Table 12 and the analytical data sheets in Appendix J, the sediments were not contaminated above the RBALs. Following analyses, the collected material was used as general on-site fill material. Water remaining in the stormwater storage tanks were treated in the recovered groundwater treatment system and discharged in accordance with CFI's NPDES permit.

8.2.2 Verification of Subgrade

After the liner was removed, the underlying soil was tested to determine if any contaminants were released from the North CAMU. The top six inches of soil was sampled and analyzed for the RBAL constituents listed in Table 2. Sampling was performed on the same 100-foot grid utilized for sampling prior to construction. Samples were collected from the 0-6 inch interval within six inches of the marked location. Results of the sampling program are presented in Table 4 and the actual laboratory data sheets are presented in Appendix B. As indicated by the data in Table 4, constituent levels in these confirmation samples did not exceed the action levels presented in Table 2. The sample locations for the baseline and the verification samples are shown on Figure 5.

8.2.3 Grading and Revegetation

Following verification testing, the soil berms were pushed in to the low areas of the unit and the disturbed area was graded, seeded with a suitable annual and perennial grass seed mixture, and mulched.

9.0 CERTIFICATION

EMS was retained by Cavenham Forest Industries, Inc., to ensure that the Soil Corrective Action Plan for the Mobile Alabama facility would be followed. EMS provided oversight of the excavation of the targeted soil and operations of the CAMUs. These services included overseeing the construction of the CAMU, sampling and testing of the soils in the AOCs, excavating and treating soils and materials that did not meet the RBALs, monitoring the bioremediation treatment on the CAMU, sampling and testing the bioremediation windrows, backfilling the excavations with treated soils, closing the CAMUs, documenting activities and certifying the facility has met the requirements of the *Soil Corrective Action Work Plan.*

Based on the observations, laboratory and field testing results, and the data presented herein, EMS certifies the facility has met the requirements as outlined in *Soil Corrective Action Work Plan* of April 1995.

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel, properly gathered and evaluated the information submitted. Based upon my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. RE: Plant Site, Mobile, Alabama

Dear Mr. Russell:

We are forwarding to you copies of the following documents which we recently recorded relative to the closeout of the above referenced site:

1. Declaration of Notice of Use Restrictions for Cavenham Forest Industries, Inc., recorded in Real Property Book 3606, Pages 702-703.

2. Declaration of Notice to Deed for Cavenham Forest Industries, Inc., recorded in Real Property Book 3605, Pages 423-424.

3. Survey of Hazardous Waste Management Area recorded in Map Book 48, Page 39.

The original recorded documents will not be returned from the Probate Court for several weeks yet. However, should you have need of them, we will be happy to provide them to you as soon as they are returned. Please advise if you do have need of the original documents.

If there are any questions or we can be of further assistance to you on this project, please let us know.

Sincerely,

MIKELL D. SPEAKS & ASSOCIATES
CONSULTING ENGINEERS, INC.

STATE OF ALABAMA)
COUNTY OF MOBILE)

DECLARATION OF NOTICE TO DEED

FOR

CAVENHAM FOREST INDUSTRIES, INC.

KNOW ALL MEN BY THESE PRESENTS, that this Notice to Deed is herewith provided by CAVENHAM FOREST INDUSTRIES, INC., hereinafter sometimes referred to as the "Owner";

W I T N E S S E T H :

WHEREAS, the undersigned is the Owner of the real property in the County of Mobile, Alabama, and described as follows:

That parcel of land located in Section 44, Township 4 South, Range 1 West, Mobile County, Alabama, being more particularly described as follows: Commencing at the site of the Great Magnolia, Mobile County, Alabama; thence North 81°-32' East and along the North line of Lot 9 of the Northbend Division of the St. Louis Tract, 1262.60 feet to a point on the East right-of-way line of Herbert Street; thence South 11°-13' East and along said East line of Herbert Street, 578.09 feet to a point on the South line of Lot 7 of the said Northbend Division of the St. Louis Tract; thence South 75°-30' West and along the said South line of Lot 7, 192.25 feet to a concrete monument; thence South 32°-44'-00" West 130.17 feet; thence South 56°-43'-15" West 57.48 feet; thence South 17°-41'-00" West 676.16 feet; thence South 08°-15'-00" West 39.41 feet to the point of beginning of the property herein described, said property being the fenced perimeter of the Hazardous Material Waste Management Area; thence along the fenced perimeter, South 18°-55'-29" West 19.31 feet; thence South 28°-24'-23" East 242.65 feet; thence South 45°-13'-01" East 116.40 feet; thence South 80°-46'-21" East 310.28 feet; thence North 19°-05'-31" East 571.48 feet; thence North 38°-39'-25" West 280.35 feet; thence North 59°-08'-22" West 115.28 feet; thence North 73°-48'-13" West 241.50 feet; thence South 18°-55'-29" West 551.85 feet to the point of beginning; and

NOW, THEREFORE, Owner is providing the following notice:

NOTICE TO DEED

The property within the herein described boundaries has been used for the management of K001 Hazardous Waste, "Bottom Sediment Sludge from the Treatment of Wastewaters from Wood Preserving Processes that Use Creosote and/or Pentachlorophenol." The Hazardous Waste Management Area contains approximately 35.6 acre-feet of solidified K001 sludge and K001 contaminated soil. The use of this property is restricted under 40 CFR Subpart G and the Alabama Department of Environmental Management Administrative Code (Division 14). A survey plat is recorded in Map Book 48, Page 39 of the records in the Office of the Judge of Probate, Mobile County, Alabama, and Notice of Use Restrictions of the said

property has been filed with the Alabama Department of Environmental Management, and is recorded in Real Property Book 3606, Pages 702 - 703 in the Office of the Mobile County Clerk, Mobile, Alabama.

IN WITNESS WHEREOF, CAVENHAM FOREST INDUSTRIES, INC. has caused this instrument to be executed in its name and on its behalf by its officer thereunto duly authorized on the date set out in the acknowledgement below.

Lee T. Alford, Vice President

STATE OF MISSISSIPPI)
COUNTY OF Pike)

I, the undersigned Notary Public in and for said County in said State, hereby certify that Lee T. Alford, whose name as Vice President of Cavenham Forest Industries, Inc. is signed to the foregoing instrument, and who is known to me, acknowledged before me on this day, that being informed of the contents of the instrument, he as such officer, and with full authority, executed the same voluntarily for and as the act of said corporation.

Given under my hand and seal this the 31 day of August, 1990.

DECLARATION OF NOTICE OF USE RESTRICTIONS

FOR

CAVENHAM FOREST INDUSTRIES, INC.

KNOW ALL MEN BY THESE PRESENTS, that this Notice of Use Restrictions is herewith enacted by CAVENHAM FOREST INDUSTRIES, INC., hereinafter sometimes referred to as the "Owner";

W I T N E S S E T H :

WHEREAS, the undersigned is the Owner of the real property in the County of Mobile, Alabama, and described as follows:

That parcel of land located in Section 44, Township 4 South, Range 1 West, Mobile County, Alabama, being more particularly described as follows: Commencing at the site of the Great Magnolia, Mobile County, Alabama; thence North 81°-32' East and along the North line of Lot 9 of the Northbend Division of the St. Louis Tract, 1262.60 feet to a point on the East right-of-way line of Herbert Street; thence South 11°-13' East and along said East line of Herbert Street, 578.09 feet to a point on the South line of Lot 7 of the said Northbend Division of the St. Louis Tract; thence South 75°-30' West and along the said South line of Lot 7, 192.25 feet to a concrete monument; thence South 32°-44'-00" West 130.17 feet; thence South 56°-43'-15" West 57.48 feet; thence South 17°-41'-00" West 676.16 feet; thence South 08°-15'-00" West 39.41 feet to the point of beginning of the property herein described, said property being the fenced perimeter of the Hazardous Material Waste Management Area; thence along the fenced perimeter, South 18°-55'-29" West 19.31 feet; thence South 28°-24'-23" East 242.65 feet; thence South 45°-13'-01" East 116.40 feet; thence South 80°-46'-21" East 310.28 feet; thence North 19°-05'-31" East 571.48 feet; thence North 38°-39'-25" West 280.35 feet; thence North 59°-08'-22" West 115.28 feet; thence North 73°-48'-13" West 241.50 feet; thence South 18°-55'-29" West 551.85 feet to the point of beginning; and

WHEREAS, Owner is desirous of advising the public of certain restrictions and conditions of use (hereinafter collectively referred to as "restrictions") upon the above described property in order (a) to protect the public against improper use of the Hazardous Waste Management Area, (b) to preserve the remediation measures taken on said property, (c) to comply with applicable public laws, and (d) in general, to assure the most appropriate use of the property described.

NOW, THEREFORE, the Owner does hereby advise of the following protective restrictions:

NOTICE OF USE RESTRICTIONS

Post-closure use of property on or in which hazardous wastes remain after partial or final closure must never be allowed to disturb the integrity of the final cover, liner(s), or any other components of the containment system, or the function of the facility's monitoring systems, unless the Department finds that the disturbance:

1. Is necessary to the proposed use of the property, and will not increase the potential hazard to human health or the environment; or

2. Is necessary to reduce a threat to human health or the environment.

Reference: Alabama Department of Administrative Code
Division 14 Hazardous Waste Program
Section 14-5-.07 (8)(c)

IN WITNESS WHEREOF, CAVENHAM FOREST INDUSTRIES, INC. has caused this instrument to be executed in its name and on its behalf by its officer thereunto duly authorized on the date set out in the acknowledgement below.

Lee T. Alford, Vice President

STATE OF MISSISSIPPI)

13.0	Maintenance of Treatment System							
13.1	Site Labor - Half-time employee for operation of the recovery and injection systems and monitoring of the water treatment system during corrective action.	$38,948.83	10	$389,488.32	$0.00	20	$0.00	$389,488
13.2	Operating Expenses - costs other than site labor, including electricity, replacement parts, internal monitoring, and etc.	$28,712.28	10	$287,122.80	$0.00	20	$0.00	$287,124
13.3	Permit Monitoring - Cost of analyzing samples from NPDES outfalls and Injection wells (see attached sheet SA-6)	$7,144.00	10	$71,440.00	$0.00	20	$0.00	$71,440
13.4	Major Maintenance - 5% of 13.1 and 13.2. Subcontract costs for repairs cannot be effected by site labor.	$3,383.06	10	$33,830.56	$0.00	20	$0.00	$33,831
13.5	Report/Permitting - Semi-annual reports, renewal of permit applications, etc.	$4,000.00	10	$40,000.00	$0.00	20	$0.00	$40,000
13.6	Contingency 10% of 13.1 through 13.5	$8,218.82	10	$82,188.17	$0.00	20	$0.00	$82,188
		Total Cost for Operation of the Groundwater Corrective Action System						**$904,071**
		TOTAL COST FOR 30 YEAR POST-CLOSURE PERIOD						**$2,277,838**

Summary Worksheet - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Summary Worksheet			
Activity		**Worksheet Number**	**Cost**
1	Removal of Leachate	PC-2	$0
2	Site Security	PC-3	$1,568
3	Maintenance of Negative Cover	PC-4	$97,360
4	Maintenance and Inspection	PC-5	$134,215
5	Groundwater Monitoring	PC-6	$757,587
6	Deed Notation	PC-7	$0
7	Maintenance and Inspection of Asphalt Cover	PC-8	$0
8	Subtotal of Post-Closure Costs (Add lines 1-7)		$990,730
9	Engineering Expenses (Engineering expenses are typically 10% of post-closure costs, excluding certification of post-closure.)		$99,073
10	Certification of Post-Closure	PC-9	$5,000
11	Subtotal (Add Lines 8, 9, & 10)		$1,094,803
12	Contingency Allowance (Contingency allowances are typically 20% of post-closure care costs, engineering expenses, and cost of certification of post-closure.)		$218,961
TOTAL COST OF POST-CLOSURE CARE (Add lines 11 and 12)			**$1,313,764**

Removal of Leachate - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Removal of Leachate			
1	Volume of Leachate to be removed per event	0	gal
2	Number of Leachate removal events per year	0	events/year
3	Volume of Leachate to be removed per year (Multiply line 1 by line 2)	0	gal/year
4	Removal costs of Leachate per year (Multiply line 3 by $___per gallon)	$0.00	year
5	Number of years in the post-closure care period	30	years
Total Cost of Removal of Leachate (Multiply line 4 by line 5) (Enter total on Worksheet PC-1, Line 1)			**$0.00**

Site Security - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

1 Fencing			
1.A	Length of fencing	2000	ft
1.B	Labor, material, and equipment cost per	$0.50	$ per foot
1.C	**Cost of Fence site** (Multiply line 1.A by 1.B		**$1,000.00**
2 Corner Posts			
2.A	Number of corner posts required (if unknown, assume 4)	0.25	posts
2.B	Cost per corner post	$150.00	$ per post
2.C	**Cost to Erect Corner Posts** (Multiply line 2.A by line 2.B)		**$37.50**
3 Gates			
3.A	Number of gates required (Assume minimum of one unless otherwise specified	0.2	gate(s)
3.B	Labor, materials, and equipment costs per gate	$350	$ per gate
3.C	**Cost to install Gates** (Multiply line 3.A be 3.B)		**$70**
4 Reflector Signs			
4.A	Number of signs required (Assume a minimum of four, unless otherwise specified)	4	signs
4.B	Labor, materials, and equipment cost per sign	$115.00	per sign
4.C	**Total Cost to install Signs** (Multiply Line 4.A by line 4.B)		**$460**
TOAL COST OF SITE SECURITY (Add lines 1.C, 2.C, 3.C, and 4.C) (Enter total on worksheet PC-1, line 2)			**$1,568**

Notes: Fence is existing

Maintenance of Vegetative Cover - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

1 Mowing			
1.A	Area of cover to be mowed (Enter from worksheet LF-1, line 1.D	442,500	ft^2
1.B	Convert the area in ft^2 to MSF (thousand square feet) (Divide line 1.A by 1,000)	442.5	MSF
1.C	Labor and equipment cost per MSF	$1.70	MSF
1.D	Cost of one mowing event (Multiply line 1.B by line 1.C)	$750.34	$ per event
1.E	Number of mowing events per year	4	events/year
1.F	Number of years in the post-closure care period	30	years
1.G	Number of mowing events during the post-closure care period (Multiply line 1.E by line 1.F)	120	events
1.H	**Cost to Mow for Post-Closure Care Period** (Multiply line 1.D by line 1.G)		**$90,041**
2 Fertilizing			
2.A	Area of cover to be fertilized (Enter from line 1.B)	442.5	MSF
2.B	Labor, material, and equipment cost per MSF	$5.51	
2.C	Cost of one fertilizing event (Multiply line 2.A by line 2.B)	$2,440	per event
2.D	Number of fertilizing events per year	0.1	events/year
2.E	Number of years in the post-closure care period	30	years
2.F	Number of fertilizing events during the post-closure care period (Multiply line 2.D by line 2.E)	3	events
2.G	**Cost to Fertilize for the Post-Closure Care Period** (Multiply line 2.C by line 2.F)		**$7,319**
3 Watering			
3.A	Area of cover to be watered (Enter from line 1.B)	442.5	MSF
3.B	Labor and material cost per MSF	0.00	MSF
3.C	Cost of one watering event (Multiply line 3.A by line 3.B)	0.00	per event
3.D	Number of watering events per year	0	events/year
3.E	Number of years in the post-closure care period	30	years
3.F	Number of watering events during the post-closure care period (Multiply line 3.D by line 3.E)	0	events
3.G	**Cost to Water for the Post-Closure Care Period** (Multiply line 3.C by 3.F)		**$0.00**
TOTAL COST OF MAINTENANCE OF VEGETATIVE COVER (Add lines 1.H, 2.G, and 3.G) (Enter total on worksheet PC-1, line 3)			**$97,360**

Notes: Mobile receives in excess of 60" of rain per year. No watering required.
Cover is presently healthy and has not been fertilized since construction.

Maintenance and Inspection - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

If maintenance costs are not specifically indicated, the cost of maintaining and repairing the final cover can be estimated based on a percentage of the cost of constructing the final cover (such as 20 percent). If the unit is closed and construction costs for the final cover are not available, use landfill worksheet LF-3 through LF-6, found in Chapter 7 to estimate the cost

1 Maintenance And Repair of Final Cover				
1.A	Cost of installing clay layer (Enter from worksheet LF-2, line 1, or from owner or operator information)		$131,161.02	
1.B	Cost of installing geomembrane (Enter from worksheet LF-2, line 2, or from owner or operator information)		$183,412.17	
1.C	Cost of installing drainage layer (Enter from worksheet LF-2, line 3, or from owner or operator information)		$199,295.47	
1.D	Cost of installing topsoil (Enter from worksheet LF-2, line 4, or from owner or operator information)		$87,766.99	
1.E	Total cost of final cover (Add lines 1.A, 1.B, 1.C, and 1.D)		$601,635.66	
1.F	**Cost to Maintain and Repair Final Cover** (Multiply line 1.E by 0.20)			**$120,327.13**
2 Post-Closure Care Inspection				
2.A	Cost of conducting one inspection	$463	per inspection	
2.B	Number of inspections each year	1	inspection per year	
2.C	Cost of conducting post-closure care inspections per year (Multiply line 2.A by line 2.B)	$463	per year	
2.D	Number of years in post-closure period	30	years	
2.E	Cost to Conduct Post-Closure Care Inspections Over the Post-Closure Care Period (Multiply line 2.C by 2.D)	$13,888		
TOTAL COST OF MAINTENANCE AND INSPECTION (Add lines 1.F and 2.E) (Enter total on worksheet PC-1, line 4)				**$134,215**

Groundwater Monitoring - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Groundwater Monitoring					
1	Number of years of groundwater monitoring during the post-closure care period	10 + 20	years		
2	Cost of groundwater monitoring per year	see notes	/year		
TOTAL COST OF GROUNDWATER MONITORING (Multiply line 1 by line 2) (Enter on PC-1 worksheet, line 5)					**$757,587.10**

Notes: The estimate assumes the number of groundwater samples collected each year during the remaining 10 year corrective action period is 62. Once corrective action is complete the number of samples will be reduced to 18 samples/year consisting of 8 Point of Compliance and 1 Upgradient Well analyzed twice each year for 20 years.

Annual cost during the corrective action period based on 62 wells (See SA-8) = $58,713.00

Total cost during corrective action period = $58,713.00 * 10 years = $587,130.00

Annual cost following corrective action period based on 9 wells

Annual Cost = $58,713 x (9/62) = $8,522.85

Total cost following corrective action period = $8,522.85 * 20 years = $170,457.10

Total cost of groundwater monitoring during post closure = $757,587.10

Deed Notation - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Deed Notation			
1	Attorney Fees	$0.00	
2	Clerical and deed filing fees	$0.00	
Total Cost Of Deed Notation (Add lines 1 and 2)(Enter on worksheet PC-1, line 6)			$0.00

Notes: Deed notation has been completed

Maintenance and Inspection of Asphalt Cover - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

1 Maintenance of Asphalt Cover			
1.A	Area of asphalt cover (Enter from worksheet LF-1, line 1.D, or enter from owner or operator information)	0	yd^2
1.B	Cost of sealcoating asphalt cover per yd^2	$0	per yd^2
1.C	Cost of one sealcoating event (Multiply line 1.A by line 1.B)	$0	per event
1.D	Number of sealcoating events during the post-closure care period (if not provided, estimate sealcoating will be completed once every five years)	$0	per event
1.E	**Total Cost to Maintain Asphalt Cover** (Multiply line 1.C by line 1.D)		$0.00
2 Post-Closure Inspection			
2.A	Cost of conducting one inspection	$0	per inspection
2.B	Number of inspection per year	0	Inspections per year
2.C	Cost of conducting post-closure care inspections per year	$0	year
2.D	Number of years in post closure	30	years
2.E	**Cost to conduct Post-Closure Care Inspections Over the Post-Closure Period** (Multiply line 2.C by 2.D)		$0.00
Total Cost of Maintenance and Inspection (Add lines 1.F, and 2.E) (Enter total on worksheet PC-1, line 7)			$0

Notes: No asphalt cover is present at the site.

Certification of Completion of Post-Closure Care - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Certification of Completion of Post-Closure Care		
1	Number of units requiring certification of completion of post-closure care	1
2	Cost of certification of completion of post-closure care per unit	$5,000.00
Total Cost Of Certification Of Post-Closure Care (Multiply line 1 by 2)(Enter total on worksheet PC-1, line 10)		**$5,000.00**

Sampling and Analysis Inventory - Page 1 of 2

Cavenham Forest Industries, LLC

Mobile, Alabama

1 Number of Boring And Subsurface Soil Samples		
(In the additional space below, identify the number of boring and subsurface soil samples being collected for each individual unit. Add the number of samples and record the total in the box provided)		
1	Number of Boring and Subsurface Soil Samples	0 Samples
2 Number of Concrete Core Samples		
(In the additional space below, identify the number of concrete core samples being collected for each individual unit. Add the number of samples and record the total in the box provided)		
2	Number of Core Samples	0 Samples
3 Number of Wipe Sample Locations		
(In the additional space below, identify the number of wipe sample locations for each individual unit. Add the number of samples and record the total in the box provided)		
3	Number of Wipe Sample Locations	0 Samples
4 Number of Aqueous Sample Locations		
(In the additional space below, identify the number of aqueous sample locations being collected for each individual unit. Add the number of samples and record the total in the box provided)		
4	Number of Aqueous Sample Locations: NPDES Permit - 52 (during corrective action) Injection Permit - 12 (during corrective action)	64 Samples

Sampling and Analysis Inventory - Page 2 of 2

Cavenham Forest Industries, LLC

Mobile, Alabama

5 Number of Nonaqueous Sample Locations		
(In the additional space below, identify the number of nonaqueous sample locations being collected for each individual unit. Add the number of samples and record the total in the box provided)		
5	Number of Nonaqueous Sample Locations	0 Samples
6 Number of Groundwater Sample Locations		
(In the additional space below, identify the number of groundwater sample locations for each individual unit. Add the number of samples and record the total in the box provided)		
6	Number of Groundwater Sample Locations Closed RCRA Landfill - 26 Semi-Annual (during corrective action) 10 Annual (during corrective action)	62 Samples
7 Number of Lysimeters to be Sampled		
In the additional space below, identify the number of lysimeters to be sampled. Record the number in the box provided.		
7	Number of Lysimeters to be Sampled	0 Samples
8 Number of Subsurface Soil Samples Collected During Monitoring Well Installation		
In the additional space below, identify the number of subsurface soil samples collected during monitoring well installation.		
8	Number of Subsurface Soil Samples Collected During Monitoring Well Installation	0 Samples

Summary Worksheet - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Summary Worksheet			
	Activity	**Worksheet Number**	**Cost**
1	Boring and Subsurface Soil Sample	SA-3	$0.00
2	Concrete Core Sample	SA-4	$0.00
3	Wipe Sample	SA-5	$0.00
4	Aqueous Sample	SA-6	$7,144.00
5	Nonaqueous Sample	SA7	$0.00
6	Groundwater Sample	SA-8	$67,498.00
7	Soil-Pore Liquid Sample	SA-9	$0.00
8	Analysis of Subsurface Soil Sample (from monitoring Well Installation)	SA-10	$0.00
TOTAL SAMPLING AND ANALYSIS COST (Add lines 1 through 8)			$74,642.00

Boring and Subsurface Soil Sample - Page 1 of 1

Cavenham Forest Industries, LLC

Mobile, Alabama

Use this worksheet when you are estimating the cost to collect soil or rock samples at depth. This worksheet estimates cost by using a drill rig or other mechanical equipment to bore or core soil and rock using various drilling methods

1 Boring and Subsurface Soil Samples Costs - 2-1/2 Inch - Diameter Hole			
1.A	Number of borings to be drilled (Enter from worksheet SA-1, line 1)	0	borings
1.B	Enter total of bore depths (Add all depths. If the depth is not provided, use the average boring depth and multiply by line 1.A)	0	ft
1.C	Labor and equipment cost per hour	0	$ per hour
1.D	Work rate to drill 2-1/2 inch diameter hole	0	$
1.E	Number of hours required to drill 2-1/2 inch diameter hole (Multiply line 1.B by line 1.D) (One hour minimum round up to the 0.5 hour)		
1.F	Cost to drill 2-1/2 inch Borings (Multiply line 1.C by 1.E)	$0	
2 Boring And Subsurface Soil Sample Costs 4- Inch Diameter Hole			
2.A	Number of borings to be drilled (Enter from worksheet SA-1; line 1)	0	borings
2.B	Enter total bore depths (Add all depths. If the depth is not provided, use the average depth and multiply by line 2.A)	0	ft
2.C	Labor and equipment cost per hour	0	per hour
2.D	Work rate to drill 4-Inch diameter hole	0	per hour
2.E	Number of work hours required to drill 4-Inch diameter hole (Multiply line 2.B by line 2.D) (One hour minimum; round up to the 0.5 hour)	0	work hours
2.F	Cost to Drill 4-Inch Borings (Multiply line 2.C by line 2.E)		$
3 Analysis of Boring Sample			
3.A	Using the table in Attachment C to this worksheet, calculate the cost of analysis per		event
3.B	Enter the number of sampling events		event
3.C	Cost to analyze Soil Samples (Multiply line 3.A by line 3.B)	$	
Total Coat of sampling and analysis of boring and soil core		$	

Notes: No drilling and/or subsurface soil sampling is planned during post-closure

Concrete Core Sample Attachment - Page 1 of 1

Cost of Analysis per Sampling Event

Cavenham Forest Industries, LLC

Mobile, Alabama

Cost of Analysis per Sampling Event Reference for Line 2.A			
Column 1	**Column 2**	**Column 3**	**Column 4**
Analytical Parameter and Method Reference	**Cost of Analysis ($) per Parameter**	**Number of Analyses, including QC Analyses**	**Total Cost of Analysis ($) per Parameter per Event (Multiply Column 2 by Column 3)**
Total Cost For Analysis Of Coring Samples (Total of all costs in column 4)			

Wipe Sample Attachment - Page 1 of 1
Cost of Analysis per Sampling Event
Cavenham Forest Industries, LLC
Mobile, Alabama

Cost of Analysis per Sampling Event Reference for Line 2.A			
Column 1	**Column 2**	**Column 3**	**Column 4**
Analytical Parameter and Method Reference	**Cost of Analysis ($) per Parameter**	**Number of Analyses, including QC Analyses**	**Total Cost of Analysis ($) per Parameter per Event (Multiply Column 2 by Column 3)**
Total Cost For Analysis Of Wipe Samples (Total of all costs in column 4)			

Aqueous Sample - Page 1 of 2

Cavenham Forest Industries, LLC

Mobile, Alabama

Aqueous samples refer to liquids samples, including samples of rinsate and wastewater. Do not use this worksheet for estimating the cost of sampling other aqueous media, such as groundwater.

1 Collection of Aqueous Sample					
1.A	Number of sampling locations (Enter from worksheet SA-1; line 4)			64	sample locations
1.B	Sampling team and equipment cost per work hour				
	Choose appropriate level of PPE				
	a. Protection Level D	*$40.00*	*/work hour*		
	b. Protection Level C	*$*	*/work hour*		
	c. Protection Level B	*$*	*/work hour*		
1.C	Work hours required to collect samples from one sampling location			1	work hr/ sample location
1.D	Number of hours required to collect all samples (Multiply line 1.A by line 1.C)			64	work hrs
1.E	**Cost to Collect Aqueous Samples** (Multiply line 1.B by line 1.D)				**$2,560.00**
2 Analysis of Aqueous Sample					
2.A	Using the table in the attachment to this worksheet, calculate the cost of analysis per sampling event for aqueous samples (Enter cost from the Attachment to this worksheet)	$72 & $40	per event		
2.B	Enter the number of sampling events	57 & 12	events		
2.C	Cost to analyze Aqueous Samples (Multiply line 2.A by line 2.B)			$4,584.00	
Total Cost of Sampling and Analysis of Aqueous Samples (Add line 1.E to line 2.C) (Enter total on cost worksheet SA-2, line 4)					**$7,144.00**

Note: Total annual cost during presently ongoing corrective action.

Aqueous Sample - Page 2 of 2

Cost of Analysis per Sampling Event

Cavenham Forest Industries, LLC

Mobile, Alabama

Cost of Analysis per Sampling Event Reference for Line 2.A			
Column 1	**Column 2**	**Column 3**	**Column 4**
Analytical Parameter and Method Reference	**Cost of Analysis ($) per Parameter**	**Number of Analyses, including QC Analyses**	**Total Cost of Analysis ($) per Parameter per Event (Multiply Column 2 by Column 3)**
Phenol 420.1	$22.00	52	$1,144.00
COD 410.4	$25.00	52	$1,300.00
Ammonia SM 4500	$20.00	12	$240.00
Nitrate SM 4110B	$20.00	12	$240.00
Toxological	$415.00	4	$1,660.00
Total Cost For Analysis Of Aqueous Samples (Total of all costs in column 4)			$4,584.00

Notes:

Toxological samples collected with other NPDES samples.

Average cost per event (NPDES) = (($2679+$1660)/52)= $72.00

Average Cost per event (Injection)= ($480/12)= $40.00

Non-Aqueous Sample - Page 1 of 2

Cavenham Forest Industries, LLC

Mobile, Alabama

Nonaqueous samples refer to sludge, chip, or surface soil samples. These samples are shallow samples, that is, they are collected at depths of less than 1.5 feet below ground surface

1 Collection of Nonaqueous Sample					
1.A	Number of sampling locations (Enter from worksheet SA-1; line 5)				sample locations
1.B	Sampling team and equipment cost per work hour				$
	Choose appropriate level of PPE				
	a. Protection Level D	*$*	*work hour*		
	b. Protection Level C	*$*	*work hour*		
	c. Protection Level B	*$*	*work hour*		
1.C	Work hours required to collect samples from one sampling location				work hr/ sample location
1.D	Number of hours required to collect all samples (Multiply line 1.A by line 1.C)				work hrs
1.E	Cost to Collect Aqueous Samples (Multiply line 1.B by line 1.D)				$
2 Analysis of Nonaqueous Sample					
2.A	Using the table in the attachment to this worksheet, calculate the cost of analysis per sampling event for aqueous samples (Enter cost from the Attachment to this worksheet)				per event
2.B	Enter the number of sampling events				events
2.C	Cost to analyze Nonaqueous Samples (Multiply line 2.A by line 2.B)				$
Total cost of sampling and analysis of nonaqueous sample (add line 1.E to line 2.c) (Enter total on worksheet SA-2, line 5					

Nonaqueous Sample - Page 2 of 2
Cost of Analysis per Sampling Event
Cavenham Forest Industries, LLC
Mobile, Alabama

Cost of Analysis per Sampling Event Reference for Line 2.A			
Column 1	**Column 2**	**Column 3**	**Column 4**
Analytical Parameter and Method Reference	**Cost of Analysis ($) per Parameter**	**Number of Analyses, including QC Analyses**	**Total Cost of Analysis ($) per Parameter per Event (Multiply Column 2 by Column 3)**
Total Cost For Analysis Of Nonaqueous Samples (Total of all costs in column 4)			

Groundwater Sample - Page 1 of 2

Cavenham Forest Industries, LLC

Mobile, Alabama

Use this worksheet to estimate the cost of sampling and analysis of groundwater monitoring wells.

1 Collection of Groundwater Sample For Closure					
1.A	Number of sampling locations (Enter from worksheet SA-1; line 6)			0	sample locations
1.B	Sampling team and equipment cost per work hour				
	Choose appropriate level of PPE				
	a. Protection Level D	*$140.50*	*work hour*		
	b. Protection Level C	*$*	*work hour*		
	c. Protection Level B	*$*	*work hour*		
1.C	Work hours required to collect samples from one sampling location			1	work hr/ sample location
1.D	Number of hours required to collect all samples (Multiply line 1.A by line 1.C)			0	work hrs
1.E	**Cost to Collect Aqueous Samples** (Multiply line 1.B by line 1.D)				$0.00
2 Analysis of Groundwater Sample For Closure					
2.A	Using the table in the attachment to this worksheet, calculate the cost of analysis per sampling event for groundwater samples (Enter cost from the Attachment to this worksheet)			$0.00	per event
2.B	Enter the number of sampling events			0	events
2.C	Cost to analyze Nonaqueous Samples (Multiply line 2.A by line 2.B)				$0.00
Total Cost of Sampling and Analysis of Groundwater for Closure(Add line 1.E to line 2.C) (Enter total on cost worksheet SA-2, line 6)					$0.00
3 Collection of Groundwater Sample For Post Closure-Care					
3.A	Cost to sample groundwater wells for one sampling event (Enter from line 1.E)			$4,392.50	event
3.B	Enter the number of sampling events per year			2	events/year
3.C	Cost to collect Groundwater Samples Annually for Post-Closure Care (Multiply line 3.A by line 3.B)			$8,785.00	per year
4 Analysis of Groundwater Sample For Post-Closure Care					
4.A	Cost to analyze groundwater samples for one event (Enter from line 2.A)			$29,356.50	event
4.B	Enter the number of analysis events per year			2	events/year
4.C	Cost to Analyze Groundwater Samples Annually for Post-Closure Care (Multiply line 4.A by line 4.B)			$58,713.00	per year
Total Cost of Sampling and Analysis of Groundwater Annually for Post-Closure Care (Add line 3.C to line 4.C)(Enter total on line 2 of groundwater monitoring worksheet PC-6 or line 3.A of post-closure care land treatment unit worksheet LT-6.)					**$67,498.00**

Note: Total cost is for annual events during presently ongoing corrective action.
Closure activities have been completed.

Groundwater Sample - Page 2 of 2
Cost of Analysis per Sampling Event
Cavenham Forest Industries, LLC
Mobile, Alabama

Cost of Analysis per Sampling Event Reference for Line 2.A			
Column 1	**Column 2**	**Column 3**	**Column 4**
Analytical Parameter and Method Reference	**Cost of Analysis ($) per Parameter**	**Number of Analyses, including QC Analyses**	**Total Cost of Analysis ($) per Parameter per Event (Multiply Column 2 by Column 3)**
BNA 8270	$610.00	69	$42,090.00
BTEX 8260	$105.00	71	$7,455.00
Metals (5) 200.7	$63.00	30	$1,890.00

Subject: New Bond

Principal: Cavenham Forest Industries, LLC c/o Three Rivers Management, Inc.
Obligee: Alabama DEM
Bond Description: Performance Bond #929600926
Bond Amount: $1,767,497.00

Dear Ryan:

Enclosed please find the above-referenced bond in response to your request. The bond is based on the information we received with the request. Please have this bond signed/sealed and forwarded to the Obligee.

In the event you do not accept and file the bond with the Obligee, please return this original document to Marsh so we can notify the surety company that the bond was not accepted and filed; otherwise, the surety company will process a premium billing for the bond.

Marsh & McLennan Companies, Inc. and its subsidiaries own equity interests in certain insurers and have contractual arrangements with certain insurers and wholesale brokers. Information is available at: http://global.marsh.com/about/Transparency.php

Should you have any questions, please do not hesitate to call.

Sincerely,

Sandra Parker
Sr. Vice President

Enclosure

PERFORMANCE BOND

Date bond executed:	January 8, 2015
Effective date:	December 15, 2014
Principal:	Cavenham Forest Industries, LLC c/o Three Rivers Management, Inc. 1910 Cochran Road Montgomery, AL 36110
Type of organization:	Limited Liability Company
State of incorporation:	Delaware
Surety(ies):	Western Surety Company 333 South Wabash Avenue, Floor 22 Chicago, IL 60604

EPA Identification Number, name, address and closure, post-closure, and/or corrective action amounts(s) for each facility guaranteed by this bond:

Cavenham Forest Industries, LLC
South End of Herbert Street
Mobile, AL 36652

EPA ID No.: ALD 057226904

Closure Amount:	$0
Post-Closure Amount:	$511,594.00
Corrective Action Amount:	$1,255,903.00
Total penal sum of bond: $	$1,767,497.00
Surety's bond number:	929600926

Know All Persons By These Presents, That we, the Principal and Surety(ies) hereto are firmly bound to the Alabama Department of Environmental Management (the "Department"), in the above penal sum for the payment of which we bind ourselves, our heirs, executors, administrators, successors, and assigns jointly and severally; provided that, where the Surety(ies) are corporations acting as co-sureties, we, the Sureties, bind ourselves in such sum "jointly and severally" only for the purpose of allowing a joining action or actions against any or all of us, and for all other purposes each Surety, but if no limit of liability is indicated, the limit of liability shall be the full amount of the penal sum.

Whereas said Principal is required, under the Alabama Hazardous Wastes Management and Minimization Act of 1978 (AHWMMA), as amended, to have a permit in order to own or operate each hazardous waste management facility identified above, and

Whereas said Principal is required to provide financial assurance for closure, or closure and post-closure care, as a condition of the permit, and

Whereas said Principal shall establish a standby trust fund as is required when a surety bond is used to provide such financial assurance;

Now, therefore, the conditions of this obligation are such that if the Principal shall faithfully perform closure, whenever required to do so, of each facility for which this bond guarantees closure, in accordance with the closure plan and other requirements of the permit as such plan and permit may be amended, pursuant to all applicable laws, statutes, rules, and regulations, as such laws, statutes, rules, and regulations may be amended,

And, if the Principal shall faithfully perform post-closure care of each facility for which this bond guarantees post-closure care, in accordance with the post-closure plan and other requirements of the permit, as such plan and permit may be amended, pursuant to all applicable laws, statutes, rules, and regulations, as such laws, statutes, rules, and regulations may be amended,

And, if the Principal shall faithfully perform corrective action at each facility for which this bond guarantees corrective action, in accordance with the corrective action plan and other requirements of the permit or correction action order, as such plan, permit, and/or order may be amended, pursuant to all applicable laws, statutes, rules, and regulations, as such laws, statutes, rules, and regulations may be amended,

Or, if the Principal shall provide alternate financial assurance as specified in ADEM Administrative Code rule 335-14-5-.08, and obtain the Department's written approval of such assurance, within 90 days after the date notice of cancellation is received by both the Principal and the Department from the Surety(ies), then this obligation shall be null and void, otherwise it is to remain in full force and effect.

The Surety(ies) shall become liable on this bond obligation only when the Principal has failed to fulfill the conditions described above. Upon notification by the Department that the Principal has been found in violation of the closure requirements of ADEM Administrative Code 335-14-5, for a facility for which this bond guarantees performance of closure, the Surety(ies) shall either perform closure in accordance with the closure plan and other permit requirements or place the closure amount guaranteed for the facility into the standby trust fund as directed by the Department.

Upon notification by the Department that the Principal has been found in violation of the post-closure requirements of ADEM Administrative Code 335-14-5, for a facility for which this bond guarantees performance of post-closure care, the Surety(ies) shall either perform post-closure care in accordance with the post-closure plan and other permit requirements or place the post-closure amount guaranteed for the facility into the standby trust fund as directed by the Department.

Upon notification by the Department that the Principal has failed to provide alternate financial assurance as specified in ADEM Administrative Code rule 335-14-5-.08, and obtain written approval of such assurance from the Department during the 90 days following receipt by both the Principal and the Department of a notice of cancellation of the bond, the Surety(ies) shall place funds in the amount guaranteed for the facility(ies) into the standby trust fund as directed by the Department.
Upon notification by the Department that the Principal has been found in violation of the corrective action requirements of ADEM Administrative Code 335-14-5, for a facility for which this bond

guarantees performance of corrective action, the Surety(ies) shall either perform corrective action in accordance with the corrective action plan and other permit or corrective action order requirements or place the corrective action amount guaranteed for the facility into the standby trust fund as directed by the Department.

The surety(ies) hereby waive(s) notification of amendments to closure, post-closure, and/or corrective action plans, permits, orders, applicable laws, statutes, rules, and regulations and agrees that no such amendment shall in any way alleviate its (their) obligation on this bond.

The liability of the Surety(ies) shall not be discharged by any payment or succession of payments hereunder, unless and until such payment or payments shall amount in the aggregate to the penal sum of the bond, but in no event shall the obligation of the Surety(ies) hereunder exceed the amount of said penal sum.

The Surety(ies) may cancel the bond by sending notice of cancellation by certified mail to the owner or operator and to the Department, provided, however, that cancellation shall not occur during the 120 days beginning on the date of receipt of the notice of cancellation by both the Principal and the Department, as evidenced by the return receipts.

The Principal may terminate this bond by sending written notice to the Surety(ies), provided, however, that no such notice shall become effective until the Surety(ies) receive(s) written authorization for termination of the bond from the Department.

[The following paragraph is an optional rider that may be included but is not required.]

Principal and Surety(ies) hereby agree to adjust the penal sum of the bond yearly so that it guarantees a new closure, post-closure, and/or corrective action amount, provided that the penal sum does not increase by more than 20 percent in any one year, and no decrease in the penal sum takes place without the written permission of the Department.

In Witness Whereof, the Principal and Surety(ies) have executed this Performance Bond and have affixed their seals on the date set forth above.

The persons whose signatures appear below hereby certify that they are authorized to execute this surety bond on behalf of the Principal and Surety(ies) and that the wording of this surety bond is identical to the wording specified in ADEM Administrative Code subparagraph 335-14-5-.08(12)(c) as such rule was constituted on the date this bond was executed.

POWER OF ATTORNEY APPOINTING INDIVIDUAL ATTORNEY-IN-FACT

Know All Men By These Presents, That WESTERN SURETY COMPANY, a South Dakota corporation, is a duly organized and existing corporation having its principal office in the City of Sioux Falls, and State of South Dakota, and that it does by virtue of the signature and seal herein affixed hereby make, constitute and appoint

Sandra Parker, Terri Morrison, Tannis Mattson, Melissa Haddick, Joe Martinez, Gina Rodriguez, Mary Pena, Elizabeth Rhodes, Individually

of Houston, TX, its true and lawful Attorney(s)-in-Fact with full power and authority hereby conferred to sign, seal and execute for and on its behalf bonds, undertakings and other obligatory instruments of similar nature

- In Unlimited Amounts -

and to bind it thereby as fully and to the same extent as if such instruments were signed by a duly authorized officer of the corporation and all the acts of said Attorney, pursuant to the authority hereby given, are hereby ratified and confirmed.

This Power of Attorney is made and executed pursuant to and by authority of the By-Law printed on the reverse hereof, duly adopted, as indicated, by the shareholders of the corporation.

In Witness Whereof, WESTERN SURETY COMPANY has caused these presents to be signed by its Vice President and its corporate seal to be hereto affixed on this 17th day of October, 2012.

WESTERN SURETY COMPANY

Paul T. Bruflat, Vice President

State of South Dakota
County of Minnehaha } ss

On this 17th day of October, 2012, before me personally came Paul T. Bruflat, to me known, who, being by me duly sworn, did depose and say: that he resides in the City of Sioux Falls, State of South Dakota; that he is the Vice President of WESTERN SURETY COMPANY described in and which executed the above instrument; that he knows the seal of said corporation; that the seal affixed to the said instrument is such corporate seal; that it was so affixed pursuant to authority given by the Board of Directors of said corporation and that he signed his name thereto pursuant to like authority, and acknowledges same to be the act and deed of said corporation.

My commission expires
June 23, 2015

J. MOHR
NOTARY PUBLIC
SOUTH DAKOTA

J. Mohr, Notary Public

CERTIFICATE

I, L. Nelson, Assistant Secretary of WESTERN SURETY COMPANY do hereby certify that the Power of Attorney hereinabove set forth is still in force, and further certify that the By-Law of the corporation printed on the reverse hereof is still in force. In testimony whereof I have hereunto subscribed my name and affixed the seal of the said corporation this 8th day of January, 2015.

WESTERN SURETY COMPANY

L. Nelson, Assistant Secretary

Form F4280-7-2012

Authorizing By-Law

ADOPTED BY THE SHAREHOLDERS OF WESTERN SURETY COMPANY

This Power of Attorney is made and executed pursuant to and by authority of the following By-Law duly adopted by the shareholders of the Company.

Section 7. All bonds, policies, undertakings, Powers of Attorney, or other obligations of the corporation shall be executed in the corporate name of the Company by the President, Secretary, and Assistant Secretary, Treasurer, or any Vice President, or by such other officers as the Board of Directors may authorize. The President, any Vice President, Secretary, any Assistant Secretary, or the Treasurer may appoint Attorneys in Fact or agents who shall have authority to issue bonds, policies, or undertakings in the name of the Company. The corporate seal is not necessary for the validity of any bonds, policies, undertakings, Powers of Attorney or other obligations of the corporation. The signature of any such officer and the corporate seal may be printed by facsimile.

GROUNDWATER MONITORING DATA SUMMARY

Groundwater Monitoring Data Summary and Statistical Analysis
Cavenham Forest Industries, Inc.
Mobile, Alabama

1.0 Introduction

This section presents a tabulation of all groundwater monitoring data collected at the Cavenham Forest Industries, Inc. (CFI) Mobile, Alabama site during the time period January 1, 2013 to the June 30, 2023 (most recent semi-annual sampling). Additionally, a statistical analysis was performed on the analytical results for metals and organic compounds. The statistical analysis focused on the last three years of results which included all groundwater analytical results obtained during the time period from January 1, 2020 to June 30, 2023 (most recent data). The last three years of data was chosen for analysis since it should be the most representative of current conditions at the site and should reduce any bias associated with older laboratory instrumentation or changes in analytical methodology that may have occurred during the larger time period. The goal of the analysis is to:

1) Determine what constituents are the best indicators of groundwater contamination at this facility; and

2) Use the information developed to focus groundwater monitoring efforts on valid constituents of concern.

2.0 Rationale

In accordance with the Post Closure Permit, during the past 10 years the facility has been analyzing the Permit ALD 057 226 904 Table III.3 list of parameters semiannually to monitor releases to the groundwater at this site. The data has produced a comprehensive database from which to characterize the nature of the groundwater contaminants.

The rationale is straight forward and is based on the following premises:

1) The waste previously managed at this site has been studied thoroughly and is well characterized. New organic or inorganic constituents are not expected to appear in the groundwater in the future.

2) Constituents that are routinely detected at the facility should be the prime candidates for inclusion in the groundwater monitoring program. Further evaluation of this list may occur based on health risk (Item 5).

3) Constituents that are rarely detected should be analyzed less frequently than parameters that are routinely detected.

4) Constituents that are never detected should be eliminated from the groundwater monitoring program.

5) Constituents that are routinely detected may be further evaluated based on health-based toxicity data to determine if less frequent monitoring is justified. For example, if a parameter is routinely detected, but the concentration never exceeds health-based criteria, the frequency of analysis may be reduced.

3.0 Statistical Analysis

Data for all metals and organic compounds were compiled into a spreadsheet for the time period January 2020 through June 2023. This data was examined to determine the number of analyses performed for each constituent during the time period. Results for duplicate analyses were removed. There were typically 231 samples collected for each organic compound and 140 samples for each metal constituent. Minimum and maximum values were defined for each parameter and frequency distributions were performed to determine the number of data points that are:

1) Less than the reporting limit and not flagged as detected between the detection limit and reporting limit, i.e., not detected during the analysis;

2) Less than the reporting limit and above the detection limit, i.e., "J" flagged as an estimated concentration;

3) Greater than or equal to the reporting limit, i.e., detected; and

4) Greater than the Groundwater Protection Standard (GWPS), which may consist of the Maximum Contaminant Levels (MCL) or EPA Regional Screening Level 10-6 Risk or Hazard Quotient 0.1.

The results of these analyses are presented in the following section.

3.0 Results and Conclusions

Table L-1 presents a summary of the statistical analysis for the organic constituents. With the exception of a few parameters, the analysis was based on 174 analyses. The table shows the detection frequency based on the reporting limit, the minimum value which is typically the lower detection limit, the maximum value detected, and the detection frequency for results that are equal to or greater than the MCL or GWPS. Comments are provided by each constituent to indicate the well or wells where it is most commonly detected. Constituents that are proposed for routine groundwater analysis are shown as highlighted values.

Table L-2 provides similar information for inorganic constituents. These constituents are presently analyzed annually resulting in a smaller database (150 analyses for each constituent). Constituents that are proposed for routine groundwater analysis are shown as highlighted values.

Table L-3 is a summary of the analytes proposed for routine groundwater monitoring. All Appendix IX constituents will be analyses on a less frequent basis. Frequency of analysis is discussed in the Groundwater Monitoring Plan.

Table L-4 provides a comparison of the March-April 2023 analytical results to the GWPS.

Table L-5 is a summary of the organic statistical results for each well.

Chromium	43	150	29%	0.00102	1.29	0.1	1	0.7%	B60A
Lead	38	150	25%	0.00105	0.0638	0.015	4	2.7%	RW-1, RW-3B, RW-5, RW-8A
Nickel	3	150	2%	0.134	0.421	0.039	3	2.0%	B60A
Chloride	171	174	98%	0.711	2230	250	30	17.2%	B-25, B-97, B-108A, B-128, E-1, GCSUMP, RC-1, RC-3

Table L-3
Proposed Groundwater Monitoring Parameters
Cavenham Forest Industries LLC
Mobile, Alabama

CONSTITUENT	
PHENOLIC COMPOUNDS	
2,4-Dinitrophenol	**PROPOSE TO REMOVE**
2,4-Dimethylphenol	2,4,6-Trichlorophenol - No Detections
2-Methylphenol	4-Chloro-3-Methylphenol - No Detections above GWPS
3 & 4-Methylphenol	
Pentachlorophenol	
POLYCYCLIC AROMATIC HYDROCARBONS (PAHs)	
2-Methylnaphthalene	
Acenaphthene	**PROPOSE TO REMOVE**
Anthracene	Acenaphthylene - No EPA Screening Level
Benzo(a)anthracene	Carbazole - No EPA Screening Level
Benzo(a)pyrene	Phenanthrene - No EPA Screening Level
Benzo(b)fluoranthene	
Benzo(k)fluoranthene	
Chrysene	
Fluoranthene	
Fluorene	
Indeno(1,2,3-c,d)pyrene	
Naphthalene	
Pyrene	
REMAINING ORGANIC CONSTITUENTS	
Benzene	**PROPOSE TO REMOVE**
Bis(2-ethylhexyl)phthalate	Ethylbenzene - One Detection above GWPS in One Well
Dibenzofuran	Di-n-octyl phthalate - One Detection above GWPS in One Well
METALS/INORGANICS	**PROPOSE TO REMOVE**
Arsenic	Chromium - One Outlier Detection above GWPS in One Well
Lead	
Nickel	
Chloride

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Volatile Technician Comments - BSF:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

2,4-Dinitrophenol, Di-n-octyl phthalate

0D01013-DUP1, 0D01013-BLK1, 2003577-01[Mobile/T-1], 2003577-02[Mobile/ RW-10], 2003577-07[Mobile/RC-3], 2003577-08[Mobile/GC-Sump], 2003577-09[Mobile/RC-2]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

2,4-Dinitrophenol, Di-n-octyl phthalate

0D01013-BS1, 0D01013-BSD1, 0D01013-MS1

CC-04 CCV exceeds acceptance limits. Results reported are estimated values.

Di-n-octyl phthalate

0D01013-BS1, 0D01013-BSD1

L1 LCS and/or LCSD Recovery Limit exceeded.

Di-n-octyl phthalate

0D01013-BS1, 0D01013-BSD1

M5 Spike amounts should be in the range of 1 to 5 times the background level when a sample contains the target parameter in order to effectively evaluate spike recoveries. Batch acceptance is based on LCS/LCSD recoveries.

Naphthalene

0D01013-MS1

SR06 Base/Neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.

Nitrobenzene-d5, Terphenyl-dl4

2003577-07[Mobile/RC-3], 2003577-09[Mobile/RC-2]

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 03/10/2020 16:23. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Sample Receipt Comments-SSK:
Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found.

Volatile Technician Comments - BSF:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

8270 Low Level Analytes by GC/MS-8270 PCP by GC/MS

Qualifiers:

B-07 Possible Laboratory Contamination

Pentachlorophenol

0C16018-DUP1

HT-21 The sample was originally analyzed within the recommended hold time. Due to a QC issue or Result Check the sample was reanalyzed outside the recommended Hold Time.

Analyte & Samples(s) Qualified:

2003208-01RE1[Mobile/RW-2]

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

2,4,6-Tribromophenol

2003208-01[Mobile/RW-2]

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

B-07 Possible Laboratory Contamination

Bis(2-ethylhexyl)phthalate

0C16032-DUP1

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

Benzo (b) fluoranthene, Carbazole

2003208-03[Mobile/B-25]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

Benzo (b) fluoranthene, Carbazole

0C16018-BS1, 0C16018-BSD1

M2 MS/MSD Recovery below acceptable limit.

Carbazole

0C16032-MS1

P3 Sample/Sample Duplicate RPD exceeded acceptance criteria.

Anthracene, Bis(2-ethylhexyl)phthalate

0C16018-DUP1, 0C16032-DUP1

SIM PAH Analysis by GC/MS-EPA 8270D

Qualifiers:

SR01 The surrogate recovery for this sample is not available due to sample dilution required from high analyte concentration and/or matrix interferences.

Terphenyl-dl4

2003208-01[Mobile/RW-2]

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

2,4,6-Tribromophenol

0C16032-DUP1

SR06 Base/Neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.

Terphenyl-dl4

0C16032-BLK1

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 03/11/2020 16:00. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Sample Receipt Comments-SSK:
Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found.

Volatile Technician Comments - BSF:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 03/12/2020 16:02. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Sample Receipt Comments-SET:
Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found.

8270 Low Level Analytes by GC/MS-8270 PCP by GC/MS

Qualifiers:

B-07 Possible Laboratory Contamination

Pentachlorophenol

0C16018-DUP1

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

B-07 Possible Laboratory Contamination

Bis(2-ethylhexyl)phthalate

0C16032-DUP1

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

Benzo (b) fluoranthene, Carbazole

2003275-01[Mobile/B-65], 2003275-02[Mobile/B-101], 2003275-03[Mobile/B-60A]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

Benzo (b) fluoranthene, Carbazole

0C16018-BS1, 0C16018-BSD1

M2 MS/MSD Recovery below acceptable limit.

Carbazole

0C16032-MS1

P3 Sample/Sample Duplicate RPD exceeded acceptance criteria.

Anthracene, Bis(2-ethylhexyl)phthalate

0C16018-DUP1, 0C16032-DUP1

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

2,4,6-Tribromophenol

0C16032-DUP1

SR06 Base/Neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.

Terphenyl-dl4

0C16032-BLK1, 2003275-04[Mobile/RC-3A]

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Volatile Technician Comments - BSF:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

8270 Low Level Analytes by GC/MS-8270 PCP by GC/MS

Qualifiers:

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

Phenol-d5
0C25015-MS1, 2003390-04[Mobile/B-24]

Total Metals-EPA 200.8 Rev 5.4

Qualifiers:

IS-04 Internal standards for this sample were above the acceptable criteria range. QC results within acceptable limits.

Chromium [He]
0C24032-MSD1

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Sample Receipt Comments-SSK:
Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found.

Volatile Technician Comments - BSF:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

8270 Low Level Analytes by GC/MS-8270 PCP by GC/MS

Qualifiers:

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

Phenol-d5
0C25015-MS1

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

Di-n-octyl phthalate
0C23044-BLK1, 2003415-01[Mobile/RW-9]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

Di-n-octyl phthalate
0C23044-BS1, 0C23044-BSD1

L3 LCS/LCSD Precision Limit exceeded.

Pyrene
0C23044-BSD1

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 07/29/2020 15:58. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found. Both pH samples received out of hold time.- SET

Volatile Technician Comments - SAD:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

Extraction Technician Comments-KLP:
Sample RW-2 was used as DUPLICATE on LL extraction. Visible difference between sample and sample duplicate.

8270 Low Level Analytes by GC/MS-8270 PCP by GC/MS

Qualifiers:

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

Phenol-d5

0H05064-BLK1, 0H05064-BS1, 0H05064-BSD1, 0H05064-DUP1, 2007556-01[Mobile/RW-1], 2007556-02[Mobile/RW-2]

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

4-Chloro-3-methylphenol, Di-n-octyl phthalate

0H05064-BLK1, 0H05064-DUP1, 2007556-01[Mobile/RW-1], 0H03042-DUP1, 2007556-02[Mobile/RW-2]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

4-Chloro-3-methylphenol, Di-n-octyl phthalate

0H05064-BS1, 0H05064-BSD1, 0H03042-MS1

L1 LCS and/or LCSD Recovery Limit exceeded.

Dibenz (a,h) anthracene, Indeno (1,2,3-cd) pyrene

0H03042-BS1

L3 LCS/LCSD Precision Limit exceeded.

Pyrene

0H03042-BSD1

M1 MS/MSD Recovery limit exceeded.

Acenaphthene, Anthracene, Benzo (a) anthracene, Chrysene, Dibenz (a,h) anthracene, Dibenzofuran, Indeno (1,2,3-cd) pyrene, Pyrene

0H03042-MS1

P3 Sample/Sample Duplicate RPD exceeded acceptance criteria.

2-Methylnaphthalene, Acenaphthene, Acenaphthylene, Anthracene, Benzo (a) anthracene, Benzo (a) pyrene, Benzo (b) fluoranthene, Benzo (k) fluoranthene, Bis(2-ethylhexyl)phthalate, Chrysene, Dibenzofuran, Fluoranthene, Fluorene, Indeno (1,2,3-cd) pyrene, Naphthalene, Phenanthrene, Pyrene

0H05064-DUP1, 0H03042-DUP1

SR06 Base/Neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 07/30/2020 15:51. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found. All pH samples received out of hold time.- SET

Volatile Technician Comments - SAD:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved vials. 8260D

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

Di-n-octyl phthalate

0H03042-DUP1, 2007590-01[Mobile/RC-3A], 2007590-02[Mobile/T-2], 2007590-03[Mobile/RC-2A]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

Di-n-octyl phthalate

0H03042-MS1

L1 LCS and/or LCSD Recovery Limit exceeded.

Dibenz (a,h) anthracene, Indeno (1,2,3-cd) pyrene

0H03042-BS1

L3 LCS/LCSD Precision Limit exceeded.

Pyrene

0H03042-BSD1

M1 MS/MSD Recovery limit exceeded.

Acenaphthene, Anthracene, Benzo (a) anthracene, Chrysene, Dibenz (a,h) anthracene, Dibenzofuran, Indeno (1,2,3-cd) pyrene, Pyrene

0H03042-MS1

P3 Sample/Sample Duplicate RPD exceeded acceptance criteria.

Benzo (a) anthracene, Bis(2-ethylhexyl)phthalate, Fluoranthene

0H03042-DUP1

pH-SM 4500-H+B-2011

Qualifiers:

HT-02 At the time of receipt, this sample had already exceeded the recommended holding time.

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 08/12/2020 15:30. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found. All pH samples received out of hold time.- SET

Volatile Technician Comments - SAD:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved

8270 Low Level Analytes by GC/MS-8270 PCP by GC/MS

Qualifiers:

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

Phenol-d5

2008233-04[Mobile/RW-4], 2008233-05[Mobile/RW-5]

Semi-Volatile Compounds-EPA 8270D

Qualifiers:

CC-01 CCV exceeds acceptance limits. Sampe results reported from this calibration were below the reporting limits.

2,4-Dinitrophenol, Dibenz (a,h) anthracene, Indeno (1,2,3-cd) pyrene

0H18037-BLK1, 0H18037-DUP1, 2008233-03[Mobile/RW-3A], 2008233-04[Mobile/RW-4], 2008233-05[Mobile/RW-5]

CC-03 CCV exceeds acceptance limits. QC Results reported from this calibration within acceptance limits.

2,4-Dinitrophenol, Dibenz (a,h) anthracene, Indeno (1,2,3-cd) pyrene

0H18037-BS1, 0H18037-BSD1

CC-04 CCV exceeds acceptance limits. Results reported are estimated values.

Dibenz (a,h) anthracene

0H18037-BSD1

L1 LCS and/or LCSD Recovery Limit exceeded.

Dibenz (a,h) anthracene

0H18037-BSD1

SR05 Acid surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two acid surrogates.

2,4,6-Tribromophenol

0H17037-DUP1

SR06 Base/Neutral surrogate recovery outside of control limits. The data was accepted based on valid recovery of remaining two base/neutral surrogates.

2-Fluorobiphenyl

0H17037-DUP1

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 08/13/2020 15:51. If you have any questions concerning this report, please feel free to contact the office.

Clyde Woodward

President
Micro-Methods Laboratory, Inc.

DISCLAIMER

The results only relate to the items or the sample and/or samples received by the laboratory. This report shall not be reproduced except in full, without the approval of the laboratory. All NELAP certified test methods performed meet the requirements of NELAC 2009 Standards. Any variances and/or deviations specific to this analytical report are referenced in the lab report using qualifiers and detailed explanations found in the case narrative.

CASE NARRATIVE SUMMARY

All reported results are within Micro-Methods Laboratory, Inc.defined laboratory quality control objectives unless detailed in narrative summary or identified as qualifications. NOTE: All results listed on this report are calculated on a wet weight basis (as received by the laboratory) unless otherwise noted in the analysis qualification sections.

Summary Comments:

Volatile vials checked at receiving for air bubbles. No visible air bubbles greater than 6mm found. All pH samples received out of hold time.- SET

Volatile Technician Comments - SAD:
Sample(s) analyzed with zero headspace. 8260D
pH of sample(s) is less than two in preserved

Report Definitions

TNC	Too Numerous To Count
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the minimum reporting limit
NR	Not Reported
RPD	Relative Percent Difference
ICV	Initial Calibration Verfiication
CCV	Continuing Calibration Verification Standard
SSV	Secondary Source Verfication Standard
LCS	Lab Control Spike - Lab matrix prepared with known concentration of analyte/s of interest analyzed by method.
MS	Matrix Spike - Sample prepared with known concentration of analyte/s of interest analyzed by method.
MSD	Matrix Spike Duplicate - Duplicate sample prepared with known concentration of analyte/s of interest analyzed by method.
MRL	Minimum Reporting Limit
%REC	Percentage Recovery of known concentration added to matrix
Batch	Group of samples prepared for analysis not to exceed 20 samples.
Matrix	Material containing analyte/s of interest
Surrogate	Analyte added to sample to determine extraction efficiency of method.

RE: Mobile Quarterly Wells New Permit

Enclosed are Micro-Methods Laboratory, Inc. results of analyses performed on samples received 03/09/2021 15:45. If you have any questions concerning this report, please feel free to contact the office.

Sincerely,

Mitch Spicer

Lab Director
Micro-Methods Laboratory, Inc.
